"The great point today, and what we are coming to in the advertising field is self-supporting advertising. That is a thing that I believe will come, and I am not a theorist, as I want to impress upon you; but if you could turn an electric-light plant into a commercial proposition and educate the people that they must use more electric current or more gas, you are making that property more valuable and increasing its earning power, and that is what you want to do. It is simply with you all a proposition to sell more current. How are you going to do it? There are different methods. I have my own ideas. Here in Denver we carry them out. We are boastful to this one point, that we do not copy any other company. We originate and create. There has not been a piece of advertising matter sent out by the local company which has been copied from other companies. That is not necessarily a strong point in favor of it, but we have shown results. The motto of Denver some time ago was 'Forward.' Today it is 'City of Light.' Mayor Speer, who is in this room, is in favor of 'The City of Light.' The proposition was laid before him, he was told the idea, and the suggestion; a germ was created; and it developed, until today the people of the city are in favor of 'The City of Light.' I believe it is possible to educate the public that while it is dark now, it is light. The human mind is peculiar. You must know how to do it. That is good advertising.

There is one great principle in advertising. You must have something that is legitimate. You must have a solid proposition. You cannot "bunco" the public, you cannot fool them; you cannot get them to part with their money on the old theory of saying that John Smith was kicked in the head by a mule, had four teeth knocked out, took Dr. Chamberlain's cough syrup, and was cured. That won't go today. You must have something legitimate which appeals to the public."

John F. Gilchrist of Chicago said: "Even in a small community there is no doubt that advertising, although you cannot trace the direct results at all times, will do good. The company which I represent started in, possibly five or six years ago, to do a little advertising. That has been increased each succeeding year. We are issuing a bulletin, with the results of which we are entirely satisfied, and we feel that we are warranted in spending for advertising probably one-third of the entire amount which we spend for getting business. We have conducted during the last year an advertising campaign which was arranged for us by the Bates Advertising Company of New York, and have watched the results of it very carefully. They prepared for us a lot of material which was very unique and good in many ways. We have kept a closely tabulated record of all the returns which we could trace directly to it, and the amount is very considerable."

"Some stations will pride themselves on having in a year obtained 50,000 lamps. Why not double their energies and get that 50,000 lamps in six months? Supposing we do spend money, after all it comes out of the other fellow. I am thoroughly in favor of spending a very considerable amount for advertising. The question of how much should be spent, as based on your gross sales, is the problem. I should estimate it to run somewhere from two to 2½ per cent. That would include the entire costs of getting the business and the advertising; two-thirds on the soliciting force and one-third on advertising.

Percy Ingalls, Newark, N. J.: It is probably very difficult to determine just what advertising and soliciting will do for a company. Very few companies advertise one year and then give it up the next. We had an experience in one of our towns last year where, through the fact that our plant was loaded up to the muzzle and we we could not take any more business, we had to give up advertising for a while. We were under the impression that discharging most of our solicitors and giving up our advertising would not have a marked effect, and that several months would elapse before we noticed any difference in the business which came in, but, as a matter of fact, almost the very day that the men were laid off and the advertising stopped, the new business slowed up. It was only a week or two before we saw a very marked difference, and we practically did no new business until we were in shape to take on more business and begin soliciting and advertising.

R. W. Rollins of Hartford, Conn., asked Mr. Gilchrist if the bulletin issued by the Chicago Edison Company leads to any beneficial results.

Mr. Gilchrist answered that he knew that their bulletin is thoroughly appreciated. As an illustration, he said that one of their engineers, who is a very able man, but sometimes does not get on to what is going on around the office until two months after it has happened, went out to figure with a man on the question of taking current. He made certain statements to the man, and the man came back at him and said: "I have seen all that, I read it in your bulletin nearly two months ago," and this man went on to tell the engineer what else he saw in the bulletin.

Mr. Lee remarked, in regard to new business methods, it had come to his attention this spring in a territory recently acquired and in which his company's business methods and soliciting had been put in effect, that in a month's time they were able to do more business and create more new business than was done during the entire last year by the company that had the plant before they had bought it. This was in New Jersey.

E. F. McCabe of Lewistown, Pa., asked Mr. Lee what percentage of the gross income of the company he expends for advertising in a city of 10,000.

Mr. Lee said it would be rather hard to make that estimate, because their plan of campaign is rather large. They are able to buy better designs and pay more money for them, having a large campaign, covering a number of different towns, than in a town of 10,000 inhabitants. But probably one-half of one per cent. would cover it very nicely for advertising proper. That is, one-half of one per cent. on the gross earnings.

Arthur Williams of New York said: "We must not lose sight of the fact that all of our advertising is purely supplemental to personal canvassing. Both should go hand in hand. Newspapers, street cars, bulletins and billboards, follow-up letters, postal cards—all of these things should be at all times so constructed and issued as to follow up most effectively the working of your canvassing department. Advertising is a branch of the canvassing department, and in my opinion one without the other is quite incomplete. I think also that it is very important to carefully classify advertising according to the business and the men who are working in different branches of your business."

L. E. Watson, Kearney, Neb.: I am a representative of one of the small lighting plants, and, like the gentleman from New Jersey, who said he had used advertising methods until he was able to load up the plant clear to the muzzle, I want to get at the best means of advertising small plants. My advertising methods have been small, but rather unique, in the way I went at them. I was up against very stiff competition with the gas plant and had taken charge of a rather run-down electric-light plant. I made personal solicitation of a majority of the business people of the town, and directed personal letters to them. Another scheme was on particular days, such as holidays, particularly on New Years day, to send a letter to each one of our customers and prospective customers, the letter properly dated and addressed to Mrs. John Smith, we will say, having the appearance of a wedding invitation or something of the kind, gotten up as neatly as possible, setting forth some little thing in connection with our business which we had put forth.

One thing which I think brought more business than anything else was the decoration of my office with ferns and other plants. As you all know, it is an impossible thing to raise plants indoors where they burn gas of the average quality of the gas produced in the small cities. The average household wife and the average woman is a great lover of such things, and I was able, by cutting out all gas from the office, to have a beautiful display of ferns and plants. That attracted a great deal of attention, and in a very short time I had very beneficial results from that.

R. E. Allen, Walla Walla, Wash., said that, with his company, the question of getting new business has been one of paramount importance, inasmuch as it has just completed a plant which has a capacity three times the demand of the community. Last year, when the plant was bought by the present company, the electric part of it was heavily overloaded, and the only avenue for business was through the gas department. He made a campaign through the newspapers, for two reasons—one was that he wanted the friendship of the newspapers in the community, and the other was that he thought he could better reach in that way the people who would be particularly interested. He started out and took a full page in each paper each week, and after two months' advertising the gross output had increased 40 per cent. over the same month of the year before. This year's output, since January 1st, in the gas department, has not been less than 55 per cent. more than a year ago during any month of the same period.

He particularly directed his attention to the matter of small-motor business. There are no manufacturing industries there, and consequently he could get no large power business, but, through suggestion, he has secured all of the power business in the town, with the exception of four plants —two breweries, one planing mill, which had to use steam to dispose of its refuse, and a laundry.

F. W. Wilcox, Harrison, N. J.: To my mind the question of rates and the question of advertising are the most important things that concern practical electric-light success. I think the question divides itself into two parts; first, the conviction on the part of central-station companies as to the value of advertising, and, second, the undertaking of the work. I think it shows considerable progress in the matter when we find that the companies are convinced today that advertising pays. There was a time when few companies agreed that it was profitable to advertise. That is past. As to undertaking the work, I think if a vote were taken at this meeting it would be surprising to find how few companies do systematic advertising, and how few companies do any advertising at all. A few companies do it in a systematic manner, some companies do it irregularly, but a large number of companies do nothing at all. The reason in the latter case is that they have no means of undertaking the work. The members come to the meetings, and become enthusiastic about advertising, and they go home, and for various reasons the subject goes without attention, and the matter is dropped.

Following the discussion upon advertising methods, James I. Ayer of Boston read his report upon the "Progress of Electric Heating." This was discussed by E. F. McCabe of Lewistown, Pa., Earl W. Paul of Ontario, Cal., A. L. Selig of Los Angeles, P. H. Korst of Janesville, Wis., Julian B. Downey of Rawlins, Wyo., A. C. Dunham of Hartford, Conn., Arthur Williams of New York, H. W. Hillman of Schenectady, J. F. Gilchrist of Chicago, W. H. Gardiner, Jr., and C. R. Maunsell of Topeka, Kan.

The first subject to be taken up Thursday afternoon was the "Wrinkles" department, edited by H. C. Abell of New York. President Davis thanked Mr. Abell for the efficient manner in which his duties had been performed.

Following this came the report of the committee on "District Heating," which was well discussed. "Purchased Electric Power in Factories," by E. W. Lloyd of Chicago was the next paper considered, and it was read by Mr. Gilchrist, in the absence of Mr. Lloyd, who was unable to attend the convention, owing to ill health.

L. A. Ferguson of Chicago, chairman of the committee on the president's address, then presented the report of the committee, emphasizing the fact that the association should not be passive while laws placing the industry under the regulation of commissions are passed by the several states without making proper suggestions whereby such laws would be made reasonable and uniform in their provisions. Nor should it permit, without protest, the passage of any laws admittedly unduly restrictive and burdensome. The object should be to have the general laws of the several states, relating to the industry, conform to some standard, fair both to the public and to the industry.

The other members of this committee were F. W. Frueauff, George R. Stetson, Samuel Scovil and S. Carnes.

A resolution was then adopted to the effect that the executive officers be authorized to spend, during the fiscal year 1905-6, not to exceed $500 in procuring such electrical tests as in their judgment are advisable, from a competent testing laboratory, and report them as promptly as possible to each member.

Another resolution was also passed expressing the appreciation of the delegates for the work of the several committees of arrangements, in connection with the annual convention; their thanks to Mayor Speer, who so felicitously welcomed them to Denver; to Mr. Henry Wray, the secretary of the Colorado Springs Chamber of Commerce, for his efforts to make their stay in his town one long to be remembered; to all general, special and ladies' committees for their work; to the railroad companies for their excellent arrangements, and to the local press of Denver and Colorado Springs for their excellent reports of the proceedings of the convention.

Arthur Williams presented the report of the committee on deceased members. He referred in suitable terms to the demise of Baron Rothschild and George L. Bowen, honorary members, and Charles H. Peters, E. A. Leslie and George W. Davenport, active members.

### Executive Session.

At the executive session held on Thursday afternoon the following business was transacted: Report of the committee on "Relations with Kindred Organizations," by James I. Ayer of Boston (chairman); report of preliminary draft of committee on "Rates and Costs," by Charles L. Edgar of Boston (chairman); report of the committee on "Municipal Ownership," by Arthur Williams of New York (chairman); report of the committee on "Standard Rules for Electrical Construction and Operation," by Charles L. Edgar (chairman).

## Convention Notes.

George A. Grey of Chas. Shawmut Denver office was one of the best

The Standard Paint Company of New York was, as usual, represented at the convention

The Temple electric air drill of Denver was on exhibition in Denver during the convention

The John A. Roebling Sons Company of Trenton, N. J., was well represented at the convention

I. O. Maloney of the Maloney Electric Company, "the man behind the gun," came on from St. Louis

Superintendent Lamphier of the Sangamo Electric Company made a host of friends for Sangamo meters

B. K. Sweetser, sales manager of the Denver office of the New York Insulated Wire Company, was present

Baker & Co. of Newark, N. J., were represented by several men at the convention, including Mr. C. O. Baker, president of the company

James M. Perry, manager of the H. W. Johns-Manville Company of New York, with a party of ladies, was in attendance at the convention.

A. A. Serva of the Fres-Ko Chemical Company, Ft. Wayne, Ind., distributed souvenirs in the form of soldering-paste boxes, filled with candy, which made quite a hit.

Vice-president W. L. Arnold of The Arnold Company of Chicago, accompanied by his wife, was numbered among the distinguished guests.

Mr. and Mrs. W. W. Low and Messrs. Packard and Grier left Denver late Thursday afternoon and traveled to Colorado Springs in an automobile.

Secretary and Manager Charles R. Bishop of the American District Steam Company of Lockport, N. Y., dropped in from the East and was most welcome.

The Rio Grande railroad ran a big special train from Denver to Colorado Springs Friday afternoon, and its efforts were much appreciated by the delegates.

General Manager Jos. E. Montague of the Buffalo and Niagara Falls Electric Light and Power Company, as usual, proved himself a "winner" with the ladies.

Thomas G. Grier of the American Circular Loom Company, Chelsea, Mass., looked out for the interests of his company with almost more than his usual activity.

S. E. Doane of the Bryan-Marsh Company registered from Cleveland. Mrs. Doane was one of the ladies of the convention whose acquaintance was eagerly sought.

The Association of Incandescent Lamp Manufacturers of the United States did itself credit by placing its interests, as usual, in the hands of J. Robert Crouse, Jr.

E. R. Roberts of the Nernst Lamp Company, Pittsburg, was one of the most welcome at the convention. Mr. Roberts is much liked by electrical commercial men.

District Manager W. J. Parrish of the Denver office of the Burroughs Adding Machine Company gave a most interesting and practical exhibit, which illustrated the merits of his counting machines for electric-light station service.

Second Vice-president Louis A. Ferguson of the Chicago Edison Company came in the Chicago special to Denver, accompanied by Mrs. Ferguson. Mr. Ferguson was among the prominent delegates who fell victim to the caricatures of the Denver daily papers.

Superintendent J. C. McQuiston of the Westinghouse Companies' publishing department, is to be especially congratulated on his artistic and thoroughly scientific presentment of the Westinghouse display in the company's parlor at the Brown Palace.

C. A. Tupper, accompanied by Mrs. Tupper, was persevering in his efforts in the promotion of the interests of Manager Arthur Warren of the Allis-Chalmers and Bullock companies' publicity department. Mr. Tupper's parlor was one of the handsomest on the convention floor.

Thursday morning President George A. McKinlock of the Central Electric Company, Chicago, joined Mr. George D. Manson's party, and these two gentlemen, in company with Miss Manson, constituted a noble front on behalf of the Okonite and Central Electric interests.

Again it is a pleasure to make record of the indefatigable and successful efforts of Assistant Secretary Billings and her co-worker, Miss Douglas—two ladies who were in constant attendance at headquarters. There were no greater favorites among the delegates than these two.

Walter Cary is now general manager of the Sawyer-Man Electric Company of New York.

The [illegible] Electric Company [illegible] Convention [illegible] Sawyer-Man Company [illegible] counting [illegible]

The American [illegible] mobile to the [illegible] Manager H. C. Eddy of Chicago. [illegible] traveling representative [illegible] American District Steam Company; his home is the United States and [illegible]

Manager A. L. Barker of Chicago [illegible] of the Western Electric Company [illegible] Chicago with the Burlington [illegible] is an ever-welcome guest at conventions, as is Mr. Rockafellow, New York [illegible] company, who likewise was on hand at Denver.

Mrs. Harris, general sale manager of the [illegible] Lamp Company, Pittsburg, [illegible] lamp sales have come rapidly to the front under Mr. Harris' skillful handling of the [illegible] district offices and stores. Mr. Harris has received many deserved compliments on his [illegible] success.

Mr. and Mrs. Francis E. Donohoe of the American Electrical Works of Chicago were among the most welcome at Denver and Colorado Springs. Mr. and Mrs. Donohoe are enthusiastic golfers and Mrs. Donohoe particularly distinguished herself on the links of Chicago as "one of the best in the West."

The India Rubber and Guttapercha Insulating Company was represented by Manager of Sales James B. Olson. Mr. Olson has represented Mr. Habirshaw for years, and this time, as usual, he "took in" the National Electric Light Convention. Mr. Olson came on with the New York delegation over the Pennsylvania.

Assistant General Manager George R. Carr of the Dearborn Drug and Chemical Works, Chicago, was "foxy." The Dearborn perfumes were found in the hands of practically every lady at the convention; this was Mr. Carr's subtle scheme of getting in his fine work with "the husbands" and "the brothers." It worked.

Secretary Johns of the Cleveland Electric Illuminating Company; C. H. Stannard, contract agent of the Denver Gas and Electric Company, and representative Ross B. Mateer, also of the latter company, distinguished themselves as "Apache Indians" during the attack on the ladies' gathering at the Country Club luncheon.

J. P. Maloy of Springfield, Ohio, made this announcement: "I am drumming for the Weinland tube cleaners of the Lagonda Manufacturing Company." Incidentally it may be stated that Mr. Maloy announces that his company has recently taken an order for 1,000 of the Weinland tube cleaners from the Babcock boiler company.

W. W. Merrill, manager of the Chicago Fuse Wire and Manufacturing Company, whenever seen at a convention is sure to say something worth listening to about the enclosed fuse manufactured by his company. Not long ago the Chicago Fuse Wire and Manufacturing Company removed to more satisfactory quarters on Randolph Street.

President Henry L. Doherty has been "it" many times before, but this time when Denver under his guidance had such a fine convention he literally eclipsed himself. Heretofore President Doherty, besides being a man of extraordinary executive ability, has often been referred to as a "prince," this time, though, he earned the title of "king of conventions."

Master of Transportation George F. Porter carried off the laurels for electrical special trains. His duplicate of the famous Pennsylvania Limited when running west to Denver, followed by the splendid train of the Burlington Route as arranged by F. E. Bell of the Burlington, with its prize diner from the St. Louis Exposition, broke all records, so to speak.

General Manager John Speer of the Speer Carbon Company of St. Marys, Pa., was one of the most welcome guests of the convention. Mr. Speer's party consisted of Mrs. Speer and Mrs. Miller, the latter lady from Westport, Pa., near St. Mary's. The Speer party availed themselves of all the opportunities presented during the entire six days' stay in the West.

Frank C. Farrar of the advertising department of the Denver Gas and Electric Company, good-humored, quick-witted and obliging, placed many of the visitors under obligation by his courteous attention to their wants. He was always "Johnny on the spot," pleased at the opportunity of extending his assistance. He is of the stuff of which the Denver "boosters" are made.

The Federal Sign Company of Chicago, through the efforts of Manager Gilchrist, displayed an immense amount of energy by its advertising of Federal signs. The signs "N. E. L. A.," which appeared on the back of the two specials and were electrically illuminated as the trains started and passed through the country from Chicago, were made up of Federal sign letters. The Federal

[illegible]

[illegible]

[illegible]

handsome silver cups—one for ladies and one for gentlemen. The grounds were those of the Town and Gown Golf Club, and the course was over 18 holes. The prize for the ladies went to Mrs. Percy Ingalls of Arlington, N. J., and that for the gentlemen to Mr. Louis A. Ferguson of Chicago.

W. W. Low, president of the Electric Appliance Company, came on from Chicago on the Burlington special, accompanied by his wife. Mr. and Mrs. Low were leaders in the gay set, attending every social function. Their evident enjoyment was ever an inspiration to the friends that accompanied them. The Electric Appliance Company has recently built a new store and warehouse in Chicago that is one of the largest of its kind in the world.

Western Manager Haughton of the Chicago office of the Bryan-Marsh Company came out to the convention, accompanied by his wife, in the private car belonging to a prominent official of the Chicago Northwestern railway. Mrs. Haughton was one of the belles of the opening reception ball and at the other functions. The Bryan-Marsh Company made no exhibit, but Manager Haughton was untiring in keeping the Bryan-Marsh lamps before the electric-light men.

Too much praise cannot be given Eastern Passenger Agent Harry E. Heller of the Philadelphia office of the Burlington road for his interest and aid to Master of Transportation Porter in the handling of the splendid duplicate of the "Pennsylvania Limited," which was afterward pulled ahead of the Chicago Burlington special train from Chicago to Denver. Mr. Heller is a typical Burlington man, and, like his associates, Messrs. Bell, Puhl and Whitehead, "knows the business" from A to Z.

The Duncan Electric Manufacturing Company, under the skillful management of its representative, William H. Sinks, made a very interesting exhibit of the Duncan direct-current wattmeters. The up-to-date feature of these meters is the ease with which the different working parts of the meter can be inspected while in operation. This makes an ideal meter for the central-station man. Mr. Sinks reports that the Duncan factory at Lafayette, Ind., is being constantly increased in size to meet the enormous demand for this instrument.

The "Reflectric" sign was so prominent to the right of the elevator on the floor of the convention hall at Denver that many of the delegates were exceedingly complimentary to the enterprise of the Western Display Company of St. Paul. The peculiarity of this sign, as claimed by the company, is that owing to the fact that the lights themselves are screened from the eye and the sign seen only by its reflected light, it may be read at a greater distance and makes a more handsome appearance both night and day "than any other electric sign in the world."

The Wagner Electric Manufacturing Company was thoroughly well represented by Chicago Manager George B. Foster and Assistant Sales Manager V. W. Bergenthal and S. Percy Cole, the latter gentleman from St. Louis. An exhibit was made of single-phase motors, constant-speed, variable-speed and reversible motors for elevators, cranes, hoists, etc. Polyphase motors were also shown of the squirrel-cage and external-resistance types. In addition to all of these Wagner transformers were presented, also a number of alternating-current and direct-current Wagner instruments.

W. S. Crosby, one of the hosts who was untiring in his efforts to entertain the electrical visitors to Colorado Springs, joined the Rio Grande special from Denver to the Springs en route. Mr. Crosby was on hand daily, looking to the pleasure of the visitors, and took many parties to South Cheyenne Canyon, which is one of the greatest scenic attractions at the Springs. South Cheyenne Canyon is within easy driving distance of the Antlers, and its magnificent scenery was appreciated by every visitor. Mr. Crosby made many friends among the electrical fraternity who will not forget his hospitality.

The Simplex Electric Heating Company of Cambridgeport, Mass., came to the front in the persons of James I. Ayer and C. W. Richards. Without attempting to enumerate the room full of heating specials placed on exhibition by this company, it is safe to say that there was not an electrical heating device known to electrical people that was not there for inspection. The Simplex Heating Company has secured for itself a line of patronage on its heating apparatus second to none in the United States, having been engaged in the electric heating business long before it began its present rapid progress.

Nowadays no electrical convention, whether electric-light or telephonic in its nature, is ever complete without the presence of the general manager of the American Conduit Company of Chicago, A. L. Waterbury. Mr. Waterbury was kept busy meeting his host of friends from the middle West. The American Conduit Company's electrolysis-proof bituminized fiber conduit is meeting with much favor with the electric-lighting people of the United States since the dangers due to electrolysis have been found to be important. Mr. Waterbury reports a fine business during the last six months for his company.

Messrs. Puhl and Whitehead of the Burlington staff, who were in charge of the Chicago special, did honor to their chief, F. E. Bell, Chicago city passenger agent of the Burlington Route. Mr. Bell could not have made a better selection in the placing of these two courteous gentlemen on board the Chicago special to Denver as his personal representatives. Burlington men keep their promises, and Messrs. Bell, Puhl and Whitehead, to say nothing of Mr. Ream, Mr. Eustis' right-hand man at headquarters in Chicago, proved themselves individually and collectively shining examples of the truth of the above statement.

Third Vice-president and Western Manager Martin Insull of the Stanley-G. I. Electric Manufacturing Company's Chicago office arrived Wednesday and was accompanied by St. Louis Sales Engineer Thomas F. Clohesey. Mr. Insull made no attempt at an exhibit. It has now been only a few months since Mr. Insull came on from the East to assume command of the Stanley-G. I. company and already the increased business of the combined companies stands as evidence of the effectiveness of the plans laid by Mr. Insull for extending the already large business which the companies had acquired under their individual names.

Under the management of General Sales Manager J. W. Gillette the National Battery Company of Buffalo made a hit by its fine storage-battery exhibit at Denver. As an illustration of the nature of the company's product three large type X National batteries complete were shown on the floor. There were presented also for inspection a number of National Unit accumulator plates of different sizes and capacities. The National Battery Company earned the distinction of being the only exhibitor of storage batteries at the Denver convention. The car Lumen of the Burlington Chicago special was lighted by the National Battery Company.

Chicago Manager Julian Roe of the Crocker-Wheeler Company was one of the first men to be seen at the Brown Palace on the arrival of the Chicago delegation. Mr. Roe has made an enviable reputation for himself in the West as an enterprising and thoroughly reliable and very aggressive electric-light and power sales manager. As one of his friends put it, Roe "delivers all the goods." Mr. Roe in conjunction with the Denver office of the Crocker-Wheeler Company sent out an invitation to visitors to make themselves at home at the offices of the Crocker-Wheeler Company on Seventeenth Street, Denver, and was persistent in his efforts to entertain the company's friends.

The National Carbon Company of Cleveland was out in full force. Manager of Sales N. C. Cotabish, accompanied by Mrs. Cotabish, came on from Cleveland and made the trip with the Chicago train to Denver. Accompanying Mr. and Mrs. Cotabish was Assistant Sales Manager J. F. Kerlin. At the convention the above-mentioned party was joined by the following-named representatives of the company: Secretary J. S. Crider, F. H. Murray, F. J. Kysela, A. E. Carrier, F. C. Park, and last but not least, C. W. Wilkins the "Chesterfieldian master of carbonaceous products." Particular friends of the National company were presented with a handsome souvenir, an electric flash pocket lamp.

About 600 of those attending the convention—including nearly all from the East—went on to Colorado Springs, where Mr. George B. Tripp and his associates of the Colorado Springs Electric Company and many of the citizens of that enterprising city united to entertain them. The various sight-seeing tours were carefully planned and successfully carried out, and the visitors could not find words strong enough to express their admiration for what they saw at Pike's Peak, Manitou, the Garden of the Gods, Glen Eyrie, the Broadmoor Casino and the various canyons; also during the wonderful ride to Cripple Creek and at other places. The train to Cripple Creek on June 10th was run in three sections. It and the other sight-seeing tours were tendered with the compliments of the generous and warm-hearted people of Colorado Springs.

The General Electric Company made no special exhibit, but, as usual, had its "army" on hand, as follows: General Irving Hale, manager, Denver office; G. A. Woolley, supply manager, Denver office; H. C. Glaze, sales department, Denver office; C. B. Mahaffey, engineer, Denver office; J. V. Swanson, construction department, Denver office; Robert Tait, auditor, Denver office; E. E. Gilbert, lighting department, Schenectady; A. D. Babson, supply manager, New York; M. D. Grosh, Salt Lake City; O. E. Turner, Dallas, Texas; J. Scribner, lighting department, Chicago; W. F. Smith, Minneapolis; J. H. Livsey, Detroit; P. D. Wagoner, Schenectady; H. W. Hillman, Schenectady; F. G. Vaughn, Schenectady; H. J. Buddy, Philadelphia; F. H. Gale, advertising department, Schenectady; F. W. Wilcox, incandescent lamp department, Harrison, N. J.; C. B. Burleigh, Boston; H. C. Houck, Cincinnati. Manager Jesse Scribner of the electric-lighting department of the Chicago branch of the General Electric Company, as usual, personally represented General Manager B. E. Sunny of the western office. Mr. Scribner brought with him quite a party that filled a goodly portion of the car of the Chicago special.

President B. F. Vreeland of the Western Lumber and Pole Company, assisted by Mrs. Vreeland, was one of the Denver hosts to the visiting delegates. The Western Lumber and Pole Company has yards in Idaho, Montana, Michigan and Wisconsin. Mr. Vreeland reports at the present time a most satisfactory business. He states that the present season sees the company literally loaded with orders and daily shipping to nearly every state in the Union. Some exceedingly large orders have come in recently which put him in a decidedly pleasant frame of mind with which to attend the convention. He reports a fine demand for poles from the Southwest and even from Mexico. The company distributed a very handsome celluloid-covered notebook.

John Craig Hammond was one of the busiest men at the convention. He is a clever advertising expert and at the head of the Hammond Advertising Company, which handles the advertising of the Denver Gas and Electric Company and other central-station companies. A few years ago Mr. Hammond was a young newspaper reporter in Chicago, but later he removed to Denver, where he has made a great success. He is president of the Press Club, a member of the Chamber of Commerce, chairman of the executive committee of the Ad Club, and interested in several business enterprises in Denver and New York. Mr. Hammond is a bright fellow, with a resourceful mind, an aptitude for hard work and the quality of attracting all men to him as friends. Mrs. Hammond—a charming woman—is a fit helpmate and graciously assisted the visiting ladies in enjoying the sights of Denver.

When I. A. Bennett appears at a convention Osburn flexible conduit "do move." Mr. Bennett was literally an advertising emporium. Stick pins, buttons, pencils, red, white and blue silk ribbons and a number of other ingenious advertising "eye catchers" emanated from Bennett and told the story not only of the many merits of Osburn flexible conduit but did most excellent work for the Marion Insulated Wire and Rubber Company, the Reynolds Electric Company, the Uehling-Decker Company and the Benjamin Electric Manufacturing Company. Incidentally it may be said that President Benjamin of the Benjamin Electric Manufacturing Company was on hand and co-operated with Mr. Bennett on behalf of Benjamin arc burst clusters. Mr. Bennett's magazine for distribution to local central stations excited interest on the part of visiting delegates. One of the most welcome visitors at the Bennet exhibit was Bennet, Jr.

Among the electrical men at the Denver convention who distinguished themselves for originality and aggressiveness in presenting the interests of their companies was General Sales Agent Charles G. Burton of the National Electric Company of Milwaukee. Mr. Burton operated in conjunction with the Hendrie & Bolthoff Company, Denver, in presenting the National Electric Company's display. Mr. Burton was given every license by President John I. Beggs of the National Electric Company to put his company well to the fore. Among other things Mr. Burton exhibited large photographs showing the immense alternating and direct-current machines now being turned out by the National Electric Company. He also presented to friends of the company the National watch fob. No better evidence of Mr. Burton's work can be given than to state that the Denver Times picked out his exhibit and advertising methods for special mention in one of its convention issues.

Sales Manager John W. Brooks of Pass & Seymour, porcelain manufacturers of Solvay, N. Y., arrived in Chicago Friday of last week, and in company with his western manager, Julian Jackson, was at the train "speeding the parting" of their host of friends, who left Chicago for Denver on the two electric-light specials. Mr. Brooks came west alone on the Chicago special and was in constant attendance throughout the Denver gathering. Pressure of business in the East, however, necessitated his leaving without availing himself of the social features that were so hospitably offered by Colorado Springs. It is believed that the increase in the Pass & Seymour factory is largely due to the broad-gauge policy so energetically and aggressively pursued by Sales Manager Brooks. Mr. Brooks was appointed to his position several years ago by General Manager Salsbury. He was chosen by Mr. Salsbury for his present position through his record-breaking work as local sales manager at the Chicago office.

One of the most welcome visitors at the Denver convention was President C. Edward Browne of the American Electrical Supply Company of Chicago. Mr. Browne took the occasion to become a member of the National Electric Light Associa-

hour and proved himself a thoroughly "good fellow." Mr Browne was accompanied by Mrs Browne, and judging from the number of friends made by "the Brownes," it may safely be said the American Electrical Supply Company will never be represented at any other electrical convention unless Mrs Browne has a place on it. Still Mr Browne thoroughly advertised his company by the distribution of grip tags, but his smile and "glad hand" put the tag in the shade, so to speak. The American Electrical Supply Company has recently forged rapidly to the front through the energetic efforts of Messrs. Browne and Phillips. At the present time it has some of the most substantial agencies in the United States. Within a few weeks the American company has added to its already long list the agency for Fostoria lamps.

The Fort Wayne Electric Works of Fort Wayne, Ind., presented one of the novelties of the convention. The Wood prepayment wattmeters exited much interest on the part of central-station men confronted with the problems which confront every central-station man and have such a tremendous bearing upon his dividends. As explained by Factory Manager J. J. Wood, who was in attendance, the Wood prepayment wattmeter applies particularly as a preventive to consumers whose credit has been found to be bad; consumers who are chronic faultfinders; consumers who are not able financially to make the required deposit; consumers employing electric signs for advertising purposes; consumers operating automobile charging stations, etc. A pamphlet entitled "Notes on Prepayment Wattmeters" will be sent upon application. The Fort Wayne company was out in force. Sales Manager and Treasurer F. S. Hunting was in command, seconded by Assistant Sales Manager A. A. Serva, Factory Manager J. J. Wood, Chicago Manager Walter S. Goll and A. A. Searls, manager of the Grand Rapids (Mich.) office.

The Phelps Company of Detroit, Mich., was on hand, as usual, with a very attractive exhibit of Hylo turn-down lamps and self-flashing sign specialties. Three styles of Hylo lamps were shown, namely, the original Hylo, which is still very popular; the pull-string, especially designed for short ladies and high fixtures, and the long-distance, or lazy man's lamp, which has a switch at the end of a cord of any desired length. Two years ago, at the National Electric Light convention in Chicago, the Phelps Company exhibited its first self-flashing Hylos, having an automatic device within the base, which alternately lights the large and the baby filament, producing a novel flashing effect. Since then it has brought out the self-flashing socket plug or "Skeedoodle" which lights a common lamp and puts it out, lightning-bug fashion. The company also makes a very attractive Wynk sign frame for merchants' daily announcements. This is equipped with two-candlepower lamps and has a flasher attached, which puts the lamps out and lights them in unison. They are made in three styles. A recent novelty is a large turnip-shaped lamp, decorated with any name or legend. This is done by a new process and is very beautiful and durable. Each lamp has a "Skeedoodle" of its own, and flashes out and on continually. The display was made up of these various lamps and devices, and a variety of signs and transparencies, illustrating their use. Hanging on the walls the visitor saw the official certificates of highest award from the Louisiana Purchase Exposition for turn-down lamps, self-flashing sign lamps and self-flashing socket plugs. The Hylo cigarette was a very unique souvenir. It was generally conceded, however, that the quality of the talk was much better than the smoke. The company was represented by President W. E. Phelps, Secretary J. Wiley Phelps and S. J. Dutch, Denver representative.

The Allis-Chalmers Company made preparations to be well represented at the convention. A number of prominent officers and heads of departments for whom reservations had been made at the Brown Palace and Savoy hotels found themselves unable to attend, but 11 delegates from the company were present during the entire session. The list is as follows: O. A. Stranahan, manager power department, Milwaukee; M. C. Miller, executive department, Milwaukee; C. A. Tupper, publicity department, Milwaukee; J. R. Jeffrey, assistant secretary, Bullock Electric Manufacturing Company, Cincinnati, Ohio; David Hall, assistant chief electrical engineer, Cincinnati; Louis E. Bogen, engineer, electrical department, Cincinnati; George H. Berg, district manager, Boston; George B. Foster, district manager, Chicago; R. B. McConney, district manager, Denver; H. L. Woolfenden, electrical department, district office, Denver; R. J. Glendenning, assistant district manager, Salt Lake, Utah. A large reception room in the immediate vicinity of the convention hall was elaborately furnished and carpeted with costly Navajo rugs. The walls were hung with framed photographs representing Bullock electrical apparatus and leading installations, and bulletins elaborating on these themes covered two large tables. The new Allis-Chalmers binders, which are so arranged as to permit the bulletins inserted to lie perfectly flat when open, attracted much attention, and many of the leaflets [illegible] the leader [illegible] the Chicago Convention [illegible] hotel to take guests to the Gas and Electric Company's [illegible] Chalmers and Bullock apparatus. [illegible] and to be the largest exhibit [illegible] between the Mississippi River and the Pacific. Altogether the Allis-Chalmers Company [illegible] on to feel gratified with the impression [illegible] produced as one of the leading [illegible] electrical field, and it will doubtless receive its full benefit from the convention. [illegible] lavishly distributed, with straps for converting them into watch fobs, were much sought by the delegates, and will serve to hold in memory the impression made by the Allis-Chalmers Company.

Of particular interest to central-station men at the convention was the work that is going on in Denver to educate the consumer and the possible consumer of electric current. Probably no city in the country has more to teach of method and persistency in the work of marketing the commodity which central-station men have to sell. It followed that on Wednesday evening, when Mr Ingalls's paper, "Advertising Methods," was read, the exhibits made in the convention hall of "business-getting" literature put out by several large lighting companies attracted deserved attention. Of these, one of the most striking, both in point of originality and apparent effectiveness, was that of the advertising department of the Denver Gas and Electric Company. This department of the local lighting company's business is in charge of the Hammond Advertising Company, of which John Craig Hammond is the moving spirit, which originates special and striking advertising literature. One feature of the Denver company's exhibit was a series of handsome posters distributed as premiums to purchasers of gas and electric-heating and cooking devices. Another showed clever newspaper cartoons, the point being to show the advantages of gas and electric current as compared with coal, wood and oil for domestic purposes. Still another comprised a number of street-car advertisements. Each appeared to be a portion of the first page of a daily paper whose headlines and cartoons were made to apply in a happy manner to the instruction of users of light and heat. There were, besides, various circulars and advertising novelties; menu cards of meals to be prepared with gas ranges and electric ovens; photographs of electric signs exemplifying the motto, "Talk with Light"—in short, the whole formed a display of undoubted value for the benefit of the vendors of light, heat and power, who wish to learn how, by the use of publicity, to increase the market for their output. There were other exhibits, also of much interest, made by the New York Edison Company, Boston Edison Company, United Electric Light Company of Baltimore, Washington Electric and Railway Company, Washington, D. C., Philadelphia Electric Company, Detroit Edison Company and the Public Service Corporation of New Jersey. These were collected and arranged by T. C. Martin of New York.

The exhibit of the Westinghouse Companies, which adjoined the convention hall in the hotel, was unusually attractive on account of the handsome decorations, which were typical of the West. The Westinghouse companies made an excellent exhibit of apparatus. The display consisted of a full line of incandescent and arc lamps, lightning arresters, meters, transformers, circuit breakers, small motors, etc. The headquarters were in a room near by. Here refreshments were served to the friends of the companies and a complete line of the literature descriptive of the apparatus distributed. The interior of the Brown Palace Hotel, being open from the roof to the lobby and surrounded by circuitous balconies, made it possible to suspend from the center of the ceiling a "stringer" display sign spelling from top to bottom the name of the company. This sign was 100 feet long and extended to within 20 feet of the ground floor. The Nernst company had on exhibition a full line of its lamps at the Hotel Savoy. E. R. Roberts of its Pittsburg office was in charge. The Westinghouse delegation consisted of the following-named persons from the Westinghouse Electric and Manufacturing Company: C. S. Cook, manager of the railway and lighting department; C. B. Humphrey, manager of detail and supply department; G. B. Griffin, of the same department; H. P. Davis, assistant chief engineer; W. C. Webster, assistant to the second vice-president; Mr. Whipple, general lamp agent; P. N. Jones, manager of Pittsburg district office; L. M. Cargo, manager of Denver district office; C. E. Skinner, Paul McGahan, K. C. Randal and Clarence Renshaw, engineers; Mr. Chase of the New York sales office; W. R. Pinckard of the Chicago district office; Mr. McPherson of the Baltimore office; H. S. Sands, E. C. Means and B. S. Manuel of the Denver district office; from the Sawyer-Man Electric Company, Mr. Sawyer; from the R. D. Marthens, manager Denver office; from the Nernst Lamp Company, Max Harris, sales manager; S. Solomon, Pittsburg manager; E. R. Roberts of the Pittsburg office. The Westinghouse

## The Tantalum Incandescent Lamp.[1]

[illegible] 80 per cent. of their initial candlepower, and were [illegible] [illegible] [illegible]

one of the lumps has reduced the cross-section of the wire beside it. The break in the lamp during test, already referred to, showed considerable attenuation of the loose end.

The lamps as tested showed the following characteristics:

| Lamp. | Watts | Candle-power. | Watts Per Candle power. |
|---|---|---|---|
| Clear globes | 41.58 | 21.42 | 1.94 |
| | 36.61 | 20.09 | 1.84 |
| | 41.58 | 24.93 | 1.66 |
| | 41.58 | 21.55 | 1.93 |
| | 41.91 | 21.81 | 1.92 |
| | 41.91 | 22.59 | 1.85 |
| Frosted globes | 40.36 | 19.79 | 2.03 |
| | 40.04 | 18.54 | 2.15 |
| | 40.04 | 18.74 | 2.13 |
| | 40.48 | 19.27 | 2.09 |

The mean result from the clear globes was 22.2 candlepower at 1.85 watts per candlepower, that from the frosted globes 19.08 candlepower at 2.1 watts per candlepower.

It is interesting to note that the clear lamp gives just about one candlepower per inch of incandescent filament, which implies an intrinsic brilliancy of somewhere about 500 candlepower per square inch of filament—a figure much higher than in the ordinary incandescent lamp.

As illuminants, the lamps are certainly excellent, but their introduction raises some most interesting questions for the central-station operator.

Putting aside all the petty questions that will be raised about the new lamps for commercial reasons, the broad fact remains that we are here dealing with a bona-fide two-watt lamp, having a life fairly comparable with the carbon-filament lamps now customarily in use. Moreover, it is a competitor of these, socket by socket, and not as a substitute with particular requirements, as in the case of the Nernst lamp or the very small arcs. There is some doubt as to the life of the tantalum lamp when exposed to unusual vibration, which may perhaps bar it in some special locations, but for the everyday work of the central station there is good reason to believe it generally applicable.

Its price can hardly be said to be fixed in this country, but abroad, in Berlin, it is about $1, which will give at least a fair line on its commercial results. On this basis and with current at 10 cents per kilowatt-hour, one finds, taking the new lamp on its 600-hour rating, that the cost of its 12,000 candle-hours, including the lamp, amounts to $3.40. The same number of candle-hours from a lamp giving a mean efficiency of 3.25 watts per candle would cost $3.90, exclusive of lamps, i. e., the consumer could afford to pay $1 for the new lamp better than to take the old ones free. With current as low as five cents per kilowatt-hour, the user of tantalum lamps could only afford to pay 75 cents per lamp, as against getting carbon lamps free. That means that a sliding scale of discounts for lamps according to quantity could be made to catch the consumer at all prices ordinarily charged for current by central stations. Does this mean that the carbon lamp will shortly be down and out? Probably not, for there is no spur like competition to start up improvements, and there are some signs that carbon lamps may be improved enough in efficiency to make things interesting, at least with current at the prices charged to very large consumers. This, however, remains to be seen, and the thing which the central-station man has to meet is the immediate probability of consumers putting upon their circuits lamps taking less than two-thirds the energy per candlepower of the best lamps now in use, and thereby cutting down their meter bills enormously.

Now, broadly, what shall be the attitude of the central-station man toward this income-scalping innovation? There are some managers who may be inclined to put up a fight to discourage the user, either by raising pettifogging objections, or by trying to discriminate against two-watt lamps by readjusting discounts in various ingenious ways. The writer is very strongly of the opinion that such a policy is wrong and will certainly lead to ultimate disaster in the form of municipal restrictions or regulation of rates by law. In the long run, opposition to improvements does not pay. If, on the other hand, the central-station man hangs quietly on and gives the consumer the "glad hand," the change will work to his ultimate benefit. In the first place, the tantalum lamps now made are of 22 candlepower, instead of 16, and the filament will hardly bear much reduction in cross-section. The tendency, therefore, will be to use these slightly more powerful lamps, taking, say 42 watts, instead of a trifle over 40 watts in the 16-candlepower carbon lamps. The actual loss in energy sold is likely, therefore, to be for the present quite a little less than the difference of efficiency would indicate.

Besides this, the attraction of cheaper light will certainly bring into line new consumers, so that the net result will probably be an actual increase in sales of current, quite a little of it being along the smaller consumers who pay the higher rates. Such a change means, upon the whole, more lights connected per unit of capacity in transformers or feeders, and hence a slightly better utilization of material, and improved load. In the case of stations with underground service the change to two-watt lamps ought to bring with it increased earnings per unit of cable capacity. The fact is that improvements in the efficiency of utilization of electric energy helps the business, and it is both fruitless and inadvisable to oppose them for any short-sighted notion of small temporary savings.

I have here said nothing regarding the inevitable competition between present lamps and the newcomer. In the first place, the merits of the final issue remain to be determined, and, in the second place, competition in lamps is on the whole a good thing for the user of them, however it turns out. So far as the central station is concerned, it is a case of "dog eat dog."

The really important thing is that from now on the station manager will have to deal directly with the two-watt-lamp proposition, for there is no disguising the fact that it is here, and in a form which is quite unexpected. The appearance of tantalum lamps in quantity may be a little delayed in this country, but delay will improve them, as in the case of every new product, and will serve to assure a better understanding of their truly remarkable properties and of their possible limitations. The unexpected has certainly happened, for most engineers had long ago abandoned the idea of a lamp with a metallic filament. Only the discovery of a metal virtually new, and possessed of most sensational qualities, could have brought about the present striking result.

### Discussion.

Arthur Williams, New York: I think, Mr. President, the life of the tantalum lamp has been too limited to enable us to have had any commercial experience with it. We have had a number on test, and these tests and reports of other tests promise, I think, a very marked improvement in the economy of incandescent lamps in the future. I am of the opinion that it makes very little difference to the consumer whether he buys part of his light in current and part in lamps, or all in current, and that with this lamp, owing to the present high price, $1 in Germany, and perhaps $1.50 or $2 here, at present it will not be a serious competitor with the incandescent lamp as we now know it. As an illuminant it is certainly very interesting, and promises well for the future; but as there probably have not been more than 100 of these lamps in this country, and they have not been here long enough to be subjected to any kind of commercial tests, I do not think it would be practicable to discuss the lamp in any commercial sense. I do not think, because of the high price at which the lamp is obtainable, that it will be immediately a competitor with the ordinary incandescent lamp, because a high lamp cost will make up, in the economy of the lamp, compared with the standard we now have.

John F. Gilchrist, Chicago: The bringing out of this lamp raises a question which has been in the minds of some of the central-station men for some little time, and that is a question of selling electricity for illuminating purposes, particularly incandescent lighting, on the lamp-hour basis instead of on the kilowatt-hour basis. It can be readily seen that, should it seem wise to push this lamp hard, the first thing that the central-station man is liable to consider if he is selling current on the kilowatt-hour basis, is that it is going to cut down his income and consequently, while he may agree with Mr. Martin that it is unwise to attack anything which has merit, he may want to hold it back until he can build up his business to meet it and not impair his income too much. In the legislative action which semes to have taken the form of a wave throughout the country, the talk seems to be entirely along the lines of the kilowatt-hour, and it has occurred to me whether it is not a wise proposition for this association and the electric-light men to try to guide that legislation along the basis of charging on a flat-hour basis, so that any new lamp of this type can be put out by the central-station men with an advantage to themselves, which they can give to their customers in such degree as they see fit.

A. C. Dunham, Hartford, Conn.: I have experimented with the tantalum lamps, and I find that the tests given in this paper are practically correct. They burn a long time after the filament breaks, and it has occurred to me that the history of the osmium lamp is a curious history. They could not find osmium enough so as to make a large quantity of the lamps, and they adopted this system—putting the lamps on central stations and charging 20 cents a month rent. They pay the central station for the power consumed for the osmium lamp at the same rate as for the carbon lamp. They return the lamp and make it over into a new lamp, and the osmium lamp goes on indefinitely. There is small wasteage. I think we must find some way to get over the sudden drop, if it is sudden, on the tantalum lamp.

Dudley Farrand, Newark, N. J.: We have had two of the tantalum lamps. The first showed an efficiency of 1.99, which is better than that mentioned by Dr. Bell. That lamp, however, lasted only some 20-odd hours, a little over a day. The second lamp is still burning, and showed an efficiency of 1.68. I do not know how long that will burn. The commercial efficiency is a matter which will have to be determined. The theoretical efficiency amounts to very little. Mr. Gilchrist touched on the question of cutting down the revenue of the central station by using a high-efficiency lamp. My own opinion on that subject is that it is not going to work against the company's interest a bit. Every time you double your efficiency in the lamp you double the plant's capacity, and while the higher efficiency may tend to increase the distribution expense, the net result will all be in favor of the high-efficiency lamp. I am heartily in favor of it, and only wish we could get them in sufficient quantity to supply our business today. It will not upset all your commercial calculations. Your business will increase upon the general announcement of this lamp coming into use faster than you can get the lamps to put them into use.

W. H. Gardner, Jr., Boston: As I remember the figures, the introduction of the tantalum lamp will show a loss of current consumption, owing to the size of the lamp, of only about 20 per cent. The gain in individual candlepower per lamp, I think, will be advantageous, because the 16-candlepower lamp was introduced at a time when other illuminants, for instance gas, were of a lower candlepower than at present, and before the extended introduction of incandescent gas lighting. Therefore, the unit of illumination of the tantalum lamp shows up approximately on the same basis as its competitors. Today we have 25-candlepower gas in a great many places, and we also have the incandescent gas lighting, which is very much more brilliant. Consequently, if one lights a 16-candlepower lamp, it is very usual that one has to light two of them, in order to get the same illuminating effect. Therefore, I should say that we should welcome this increase in the size of the lamp, even if accompanied with a slight decrease in current output. That is only about 20 per cent. I will add, in this connection, that the gas industry had a very much larger decrease to face. They had formerly, with their gas at 25 candlepower, consumed five feet to the burner per hour, but when the incandescent lamp came in the consumption went down to three feet, and the candlepower went up to 50. That was very much greater difference, a greater drop, and some gas managers were not very quick to recognize the point, but I think it is now very generally accepted that it is to the advantage of the gas manager to use the incandescent gas mantle over the open flame, in spite of the shrinkage in consumption of 40 or 50 per cent. I think we should welcome the tantalum lamp.

## Municipal Ownership.[1]

By Arthur Williams.

The craze for municipal ownership will undoubtedly continue for a time, and even gain some headway. It threatens to replace the populistic movement of some years ago, and the later free-silver theories of one of our great national parties. The advocates of municipal ownership promise to accomplish, through that medium, what was formerly promised through the others—and here, for the time being at least, there may be more assurance of immediate success in carrying their ideas into the different political platforms. And there may be greater chance of ultimate success because of the greater complexity of the subject and the kind of misinformation that is now being broadly circulated over the entire country. It is natural that municipalities, after making large investment in these enterprises, should seek to justify what they have done. The least that can be said is that they will be reluctant to bring to light errors in their acts and conclusions. A tendency to suppress the bad, and give emphasis to the good—if good may be anywhere found—is to be expected. And this, as much as anything else is to be watched for in meeting these questions, with which in the near future some of the member companies may be confronted.

Æsop's fable of the fox and his lost tail here finds excellent application. The wily old fellow wished company in his misery, and, we recall, urged all the other foxes to cut off their tails. He gave as many favorable reasons as any proud possessor of a municipal plant can offer a sister municipality in urging her to do likewise. But the assembled foxes remembered that the loss of a tail is easily accomplished; that the troublesome thing is to get it back again. Municipal, like private, funds may be spent at any time—they take flight easily—with less ease one again gets possession of them.

Mr. William Richmond Smith, in his excellent work, "Municipal Trading in Great Britain," states that in the year 1875, through the exertions of Joseph Chamberlain, then mayor, the city of Birmingham, England, secured permission from Parliament to take over the gas-making plants of the private companies. The undertaking proved, for the time being, a great success, both financially and otherwise. Mr. Chamberlain as mayor gave the undertaking his personal attention. He did all in his power to make it the success which it became.

1. From the introduction to a report on the subject prepared by Mr. Williams for the National Electric Light Association and presented at Denver on June 8, 1905. The complete report makes a volume of 188 pages and is very full and valuable—a most useful book, for which central-station companies have to thank the author. Mr. Williams is general inspector for the New York Edison Company.

About the same time other municipalities of England began to engage in enterprises of the kind, the principal statistics upon that subject all date from 1875, and it is not beyond reason that the movement in Birmingham was rather to the movement elsewhere. The result, counted in that city, doubtless, were referred to as affording abundant reason why similar movement should be undertaken by other English municipalities. Here may be found an explanation for the present and general, unsatisfactory condition of municipal trading in that country. The virtue lay in the man Joseph Chamberlain not the cause, which was questionable, to say the least. The world know how many, or how few, Joseph Chamberlains there are and they are not managing municipal trading ventures.

The newspapers have heralded that Charles T. Yerkes, formerly of Chicago, has taken Mr. Young from the municipal tramways of Glasgow to manage his great railway undertakings in London. Mr. Yerkes [who is quoted from the Daily News (London) in full in the report] should be heard on this point: "Young, whom I took from the management of the Glasgow street railways, was handicapped in his work there, although he did his best to minimize political interference. Moreover, politicians of Glasgow, while ignorant, are honest. Politicians generally in Europe are comparatively honest, whereas the politicians of Chicago are the worst in the civilized world."

Suggestion is frequently offered that if the municipalities can operate their waterworks successfully, with equal success they can also operate gas and electric-light works and street railways. There is a marked distinction between water and the other systems. Water is easily pumped and distributed. For operation, it does not require a high order of technical engineering or financial competency. Of administrative and executive skill no more is required than in the care of the station houses of our police departments, and far less than in the conduct of our public schools. It should be remembered also that water is an absolute necessity to the health, to the life, of the community, and that it must be provided freely in unlimited quantities, whether any particular member of the community can or cannot pay for it. If he cannot pay for it, the general good of all demands that it shall be provided to him, even without cost.

Of education the same is true—it is a public necessity. The general welfare demands that every boy and girl shall receive at least a rudimentary education, and that, under certain conditions, they shall also receive a higher education at public expense. If unable to provide it for themselves the charge properly belongs to the state, for the benefit in better citizenship and lessened crime—to mention two of many advantages—goes to the state as well as to the individual. Thus one might reason indefinitely regarding our purely public utilities and conveniences, such as the police, the highways, the fire department, waterways and sewers.

The lighting of the highways, it must be added, is also necessary to public convenience and safety, and is a public function. From the adequate illumination of the streets all receive like benefit, and it is necessarily a general charge upon the community. Whether the service should be obtained from the private companies or from a municipal plant is purely a question of relative cost—there is no sentimental reason why a municipality should not make its own light, and there is no sentimental reason why it should do so.

But here the function of the municipality should stop. Beyond this point it must not go. It should not encroach upon the service to individuals any more than it should undertake to furnish individuals with bread and meat, with clothing, or newspapers; no more than it should conduct hotels, restaurants, theaters or the opera. Entering this field it invades the exclusive domain of private enterprise, which makes for the prosperity, and, in fact, the very existence of the community as a whole. There is, perhaps, no question that any one, or all, of the industries of a municipality could be conducted, after some fashion, by a municipal administration; nor is there any reason why, with deficits made up from general taxation, the municipality cannot compete with any kind of private enterprise.

Street illumination, whether from the central station or a municipal plant, should be a question of relative price and cost. When threatened with municipal competition, it should be made clear that prices are no more than the cost of corresponding service if derived from a municipal plant, adding an admittedly fair profit. Where incorrect figures and misleading opinions are publicly circulated, they should be corrected with equal publicity. In a matter of this kind nothing equals counteracting publicity. This is an age of reason, of eventual control through public opinion, and the lighting companies have the same weapons at their disposal for defense that their opponents have for offense. The present prominence of municipal socialism as a political question is the result of publicity largely on one side, and there should be united effort on our part to meet it and restore normal conditions. This can be accomplished with united, concerted effort; all of which is well worth while, for the question may be extended into the different political parties, and possibly into [illegible] and municipal [illegible].

Here the National Electric Light Association find a field of [illegible] been clean already, and [illegible] larger means at our disposal [illegible] results may be counted on to [illegible] last year the president of the [illegible] very active in these matters [illegible] been engaged to represent [illegible] time before the local [illegible] legislature recommended [illegible] same carefully and [illegible] one of the largest [illegible] and posted [illegible] the association has been [illegible] desired.

It might not be beyond the [illegible] cation to establish and maintain [illegible] press bureau, supplementing [illegible] work of Mrs. Billings, without special reference to whom this report would be still more incomplete and certainly it should have at all times, for the assistance of the member companies, competent legal talent, which could be called upon in the event of need. These contests will come frequently, oftentimes without warning, and they call for the best experience that can be had. The cause of one is the cause of all, and it is a gratifying sign that this fact is universally recognized by our membership.

## The Choice of an Insulated Cable.[1]

By Wallace S. Clark.

There are two distinct conditions of service. One where the amount of current is not subject to any probable increase, such as instrument, generator and transformer leads; the second comprising all lines outside of the station that may be subjected to increasing loads due to the growth of business.

For the first class, ampere capacity or mechanical strength in the case of small apparatus is the determining factor. The current-carrying capacities given in the National Electric Code for rubber insulation are a fairly safe guide and the current densities given should not be exceeded.

For the second class of conductors, the cost of power at the switchboard, the load factor of the line, the limits of loss in transmission for satisfactory regulation of potential and operation of consuming device, the heating of the cable in short lines, the probable increase in load with time and the interest charge on the cable investment are the principal factors in settling the size of conductor to be used. The Thomson law, so-called—that the most economical arrangement is where the cost of the power wasted and the interest charge on the cable investment is a minimum—is the basis of many formulæ elaborated in different books.

Having determined the size of conductor required on theoretical grounds, consideration should be given one or two very practical points. First, do not use for underground construction cables so small as to be mechanically weak. I have in mind a station with a 6,600-volt distribution where the cables run from three-conductor No. 0000 to three-conductor No. 6 in size, the No. 6 constituting the smallest part of the installation and giving more trouble than the entire remainder of the system.

Second, if you use a duct system, keep in mind the fact that the cost of duct per foot is independent of the size of the cable in the duct, and select the size of conductors so that the cables will utilize a reasonable proportion of the duct area. Two No. 8 arc-light cables, single-conductor, in a three-inch duct, costing from 20 cents to 40 cents per duct-foot, is evidently uneconomical. The standard three-inch duct will take cables of the following sizes, insulated for different voltages: Any voltage under 1,500, single-conductor cables up to 2,000,000 circular mils; concentric two-conductor cables up to 1,000,000 circular mils; three-conductor cables up to 500,000 circular mils. For 3,000 volts, single conductors up to 1,500,000 circular mils; concentric up to 750,000 circular mils; three-conductor up to 400,000 circular mils.

For 6,600-volt lines, which are practically all three-phase, the limit is found at three-conductor, 250,000-centimeter cable; on 12,000-volt lines the limit is found at three-conductor No. 0000 cable; on 24,000-volt lines at about 100,000-centimeter cable. It is assumed, of course, that the three-conductor cables are run on delta-connected circuits and have the same wall of insulation between conductors and ground as between the conductors themselves. If the three-phase circuit is run Y-connected with neutral grounded, then the outer jacket of the three-phase cable can be made considerably less in thickness and larger cables be installed in the standard three-inch duct.

The accompanying curves show the variation in cost per 1,000 circular mils of copper contained in the cable for different sizes of cables and different working electromotive forces. It will be noted that the lack of economy in the use of small conductors is most marked in the 15,000-volt class, where changing the size from No. 8 to No. 6 wire in-

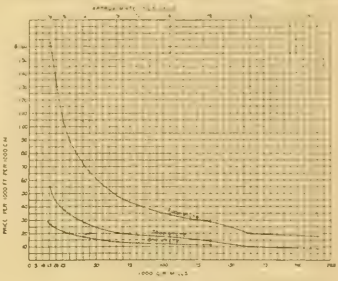
1. Abstract of a paper read before the Denver-Colorado Springs convention of the National Electric Light Association, June 7, 1905.

[illegible]

[illegible] copper and the [illegible] tration of pressure tending to break [illegible] the entire insulating wall. In short, it is easier to [illegible] working pressure than to insulate a No. 14 wire for the same purpose.

The best practice [illegible] or multiple-conductor [illegible] station wiring single conductors in separate ducts, or runways, [illegible] modern practice. [illegible] and simplicity of [illegible] this question pretty definitely. For outside lines the service will largely decide. Direct-current railway feeders are normally single-conductor.

For low-tension mains on the three-wire system, either three single-conductor cables or one three-conductor cable can be used. The three-conductor cable is slightly cheaper in first cost but not nearly as convenient for making taps to [illegible] theoretically, with alternating current there [illegible] advantage in the use of the [illegible]



CURVE SHOWING VARIATION IN COST PER 1000 CIRCULAR MILS.

For low-tension feeders, which usually exceed 250,000 circular mils in size, the concentric type of cable should be used for maximum duct economy. Smaller than 250,000-circular-mil cables may be run as a flat twin conductor, and this type of conductor is always advisable for alternating-current feeders with manhole transformers.

The common practice in arc circuits is to use single-conductor cable. Where a number of circuits are in parallel for any distance an excellent plan is to combine them into a multiple-conductor cable. This saves in first cost, in cost of installation and in cost of ducts.

Single-phase two-wire lines not exceeding No. 0000 size should be run as twin conductors unless numerous taps are made, in which case the greater convenience in making joints may justify the use of the single-conductor cable. The concentric type of cable for single-phase work is losing favor in England and on the continent and has never been in favor in this country.

I believe the majority of engineers who have had experience in central-station construction now consider that cables without metallic sheaths are better than leaded or other metal-sheath cables for this class of work. The lead sheaths are generally grounded and must be grounded in a high-tension system to prevent the accumulation of static charge. These grounded lead sheaths offer the arc from any conductor to earth in their neighborhood a ready inducement to spread and cause trouble on adjoining cables. The lead sheath on circuits exceeding 5,000 volts and on all voltages if the cable is paper or fibrous insulation must terminate in an end bell or pothead to prevent the breakdown of the cable at the terminus of the lead sheath. This end bell in addition serves as a seal to prevent the absorption of moisture in the case of paper or similar cable.

Cables for tensions not exceeding 750 volts that can be run in dry non-metallic ducts without pockets where water may collect, or on suitable incom-

bustible insulators—porcelain, glass, slate shelves, concrete, etc.—require insulation only to prevent shocks to operatives and short circuits due to mechanical causes, such as a workman dropping a wrench or bar across two bare conductors. An excellent type of cable for this work is one insulated with varnished cambric tapes and asbestos (asbestos being on the outside), finished with a flameproof braid. Such a cable can be operated continously at the boiling point of water without injury.

For pressures of 1,000 volts and upward we must use rubber cables of good quality, or some satisfactory substitute. Such cables, unless protected by individual fireproof runways, should be protected on the outside by an asbestos jacket. This jacket will prevent fire following along the cable or bunch of cables; it also acts as a protection to a considerable extent from the destructive action of an arc from an adjoining conductor.

If rubber insulation is used it should be of good quality, and such cables cannot be cheaply made, owing to the present extremely high price of the better grades of crude material. Rubber cables should not be operated at temperatures exceeding 125 degrees Fahrenheit if reasonable long life is expected of the insulation. Lower operating temperatures are most desirable, as they will do much to prolong the life of the insulating wall. Higher temperatures cause very rapid deterioration of the insulation.

Passing to conductors outside of the stations, these may be roughly divided into transmission lines, practically always operated at potentials of 4,000 volts or more, and running to sub-stations. The second class of cables comprises the distributing systems, with feeders seldom exceeding 3,000 volts and mains to which customers are directly connected operating at 500 volts or less. Circuits outside of the station using insulated cables are practically all underground. There are a few cases where high-tension leaded cables are run on pole lines supported by a steel cable similar to telephone practice, but this may be regarded as a temporary expedient.

Underground construction in this country consists almost entirely of lead-jacketed cables in conduits, the most permanent type of duct being thoroughly vitrified tile. For installations where electrolysis can be guarded against, or is not to be feared, paper-insulated lead cables give thoroughly satisfactory service when carefully installed. Where severe electrolysis is counted on or where the ducts are filled with water for considerable lengths of time, varnished cambric or rubber leaded cables should be used to insure against interruptions of service.

Where sub-aqueous lines are called for, various constructions are possible. With narrow, shallow streams or canals the line of conduits may be dropped with deep manholes, and the ducts carried underneath the bed of the stream. This usually necessitates draining the ducts toward one manhole and providing a small pump to keep the manhole clear of water seeping in. Wide shallow streams can have a trench dredged or dug across them and cables with band-steel armor laid in the trench, which will usually be rapidly filled with silt. For deeper streams or wider streams armored submarine cable is required. A method used with success in some cases is to lay a cast-iron water main with specially bolted ball and socket joints along the bottom of the river and to draw an unarmored leaded cable through it. Tunnels can, of course, be used, but except for a very heavy line, containing a number of cables, this construction is extremely expensive, and it is cheaper to install one or more spare cables which can be switched into service in case of accident to one of the operating cables. It is perhaps well to mention here that where a submarine cable or underground cable is inserted in a pole line of any length adequate lightning protection should exist at each end of the cable.

There is one type of cable largely used in England, and almost universally in Continental Europe, of which we do not avail ourselves as much as we should for underground work. This is the so-called band iron armored cable. Leaded cable is wrapped with tarred jute, and over this with two overlapping steel tapes, each from one-thirty-second to one-sixteenth inch thick. The outer tape covers the butt joint in the inner tape and is protected against corrosion on the outside by an additional jacket of compounded jute. Such cables buried directly in the earth have been giving first-class service in some cases for 20 years. They are in use for pressures from 250 up to 15,000 volts, and lines of even higher potentials have been installed, but for too short a time to be cited.

Before it is shipped from the maker's factory every cable should be tested with an electromotive force higher than the maximum working pressure. If possible, a similar test should be made after the cable is installed and jointed. As to the relation which these test pressures should bear to the working pressure, the duration of the tests, etc., there exists considerable diversity of opinion. For a good many years the writer has advocated 2½ times the working pressure for 30 minutes to an hour as a factory test and twice the working pressure for the same length of time after the cable is installed. Cables tested under these requirements have given no indication in practice that the margin of safety was not ample. Some engineers, desiring a higher factor of safety on important and large installations, specify a factory test of three times the working pressure and a test installed of 2½ times. Any requirement more severe than this represents a questionable investment on the part of the purchaser. It is especially undesirable to make very high potential tests for very short periods of time, since the cable may be decidedly weakened by such treatment, although it does withstand the high-potential test for the brief period specified. In short, the words "breakdown test" should not appear in cable specifications, in the writer's opinion. Boilers are tested to see if they are safe for a given working pressure, but such test is not usually referred to as a bursting test. Cable tests should be considered on the same basis. They are not to show the ultimate strength of the cable, but to show that the cable is safe and satisfactory cable for the purpose for which it is intended.

It should, of course, be understood that the above refers to cables for 2,000-volt circuits or over, since in lower voltages the necessary mechanical requirements frequently call for a wall of insulation sufficient for a 3,000-volt test or even a 5,000-volt test on cables which are to operate at 250 volts. A variation in tests called for by some engineers, which is a very good one, in my opinion, is to test the cable for one hour at 2½ times the working pressure, and at the end of that period to raise the pressure to three times the working pressure for one minute.

Paper cables are not generally tested at more than 2,300 volts for each one thirty-second inch of wall; rubber cables at 2,500 volts for each one thirty-second inch of wall; varnished-cambric cables we are enabled to test with 2,800 volts for each one thirty-second inch of wall. These figures apply, of course, to the ordinary commercial cables as made today. They can be exceeded on specially made cables of all types. The size of the cable has a considerable bearing on the pressure test, and the figures above represent the practice on cables running from No. 6 and larger, for working pressures from 2,000 to 20,000 volts.

## The Organization of Working Forces in Large Power Houses.[1]

By W. P. Hancock.

The chief engineer of the steam system is, of course, totally responsible to the head of department, or his representative, for the good and economical operation of that system; and in order to be able to assume that responsibility in a manner favorable to the company's interest, and with success for himself, he must have among his various accomplishments a few which I will mention, and which I claim are extremely important.

We will assume that he came to us with the necessary license, that he has had a good and varied experience with steam engines and auxiliaries and is a first-class mechanic. Perhaps we know him by reason of his having been employed on a nearby system for some time, and, if this be the case, we have had the opportunity to see what kind of an organizer he is, what his judgment is in the hiring of men, whether he has the ability to maintain discipline among his men, and takes an interest in knowing whether or not it is maintained, and whether he plans the work of his system and passes his orders to his first assistant, to be passed by him down the line, in such a way as to avoid the bad complications caused by conflicting orders given by himself and his first assistant to a watch engineer, perhaps to others of his organization. We can see whether he has favorites among his men by reason of earlier acquaintance with them; if he has and it is apparent, we know there is trouble ahead. We can see what his inclination is when the load is going at the beginning of the summer and the pay-roll will stand a reduction, not in the rate of wages but in number of men employed. We can see whether or not he has the "hustle and push" to put the system on its feet and keep it there, without having to be reminded that it is for that purpose that he is drawing his salary; also if he takes a keen interest in matters to such a degree that if he doesn't hear from certain items in his system he will go after such items and not take it for granted that they are all right or he would have heard from them.

If arguments arise between any of the men and their superiors, does he act absolutely on his best judgment, or does he allow it to be warped because the man who is in trouble with his watch engineer is an old man—not in years, but on the system—and he thinks that man cannot do wrong?

I claim that if the head of a steam division has not the ability to take care of these matters on these lines, the organization will be far from satisfactory from the standpoint of good service and economy. Almost any chief engineer can continue to hire and discharge men at short intervals and claim that as his only alternative; but if he does, it is a loss to his employers.

The engine room is in the immediate charge of the first assistant engineer, who directs all of the work from orders given him by the chief engineer. As he, of course, cannot be on watch more than the regular hours, unless in case of emergency, the orders are transmitted by him to the watch engineers, and in absence of the chief engineer these men have, in their consecutive order, absolute control over every piece of steam apparatus and the appurtenances thereto, from the ends of the crank shafts to the outer end of the circulating water intake, including all labor incident to steam operation.

The first assistant and his watch engineers are busy men. I say "busy," because, if they are not, they are in the wrong place, for on these men we place secondarily the responsibility of the steam apparatus and its operation.

Of the watch engineers we must require as nearly as possible the duties of the first assistant, with the addition that the orders of the latter, as to work to be done during the hours he is absent, are to be strictly obeyed, and the results must show favorably when he again appears on watch.

The oilers come next in line in the engine-room, and on these men we rely to keep the engines in operation after once started, and to know absolutely that the large number of oil feeders and grease cups found to-day on reciprocating engines are in proper operation. An oiler must give immediate notice to the watch engineer of any irregularity in the operation of his machine; must see that he is using enough oil, and not more than enough, and when his machine goes off the line must wipe it up and clean it ready for the next run. These men are important in their positions, whether the title implies it or not, for power stations, unlike steamboats, can not afford to shut down to cool hot bearings, nor can we afford to let the customers drift, as the commander might let the ship drift at sea if emergency occurred and weather and sea room were favorable. I consider an oiler important when the question of hiring men comes up in the fall. I lose no opportunity to take the name and address of all men who have had experience in that line, and find such a list very useful when the fall load begins to appear.

We can now take up the operation of the boiler-room, that portion of the system which can be so handled as to assist greatly in paying dividends, and can also be handled in such a manner as to be largely the means of passing one, especially if the coal supply is uncertain as to quantity and quality, for in this latter case we must necessarily save at every other point in order partially to make good such deficiency. Therefore let us at once have the fire-room in charge of a competent man whose immediate superior is the engineer on watch. We need a man for this place who carries a first-class engineer's license; one who has had experience in the engine-room and thus understands practically how the load rises and falls; one who will keep in touch with the watch engineer and realize that it is absolutely necessary that he does keep in touch with that man and know as far ahead of time as is possible what his future needs will be.

Next come the water tenders, who are in charge of the fire-room watches when the foreman is off watch and who, in such periods, are immediately responsible to the watch engineers, and have a quota of firemen under their charge, as well as all other men of the fire-room force. The water tender may be apparently perfectly competent to occupy his position by reason of his coming to you with a proper license and a long list of recommendations from former employers, but the question will arise as to whether he will fill his proposed position.

The firemen are those of the force whom we must select with care, for the type we need must have had experience, and must have judgment and be reliable. That is to say, we can not afford to have a man with us who is afflicted with pay-day sickness. We want him eight hours a day, seven days a week, and I am glad to say we have a large number of this kind who like their positions well enough to work steadily for the periods mentioned above. We want men who will obey the instructions given them by their superiors, and those who are free from connection with any organization that would interfere with men that are getting satisfactory wages and treatment and are contented. We want men who, when occasion requires, will hand-fire 2,000 pounds of coal an hour, and do so for several hours, if necessary. We want men who will burn coal, and not simply dispose of it; men who will use judgment in both firing and cleaning fires, and if the plant is using stokers of the type we use on our system, it is of the greatest importance that he should watch the coal as it comes to him and regulate the depth of the feed and the speed of the grate in accordance with both the quality of the fuel and the demand for steam as his best judgment dictates, and act promptly on instructions given.

Firemen are a class of men who must of necessity do very hard work, and they are also a class of men upon whom the power stations are to a large degree dependent for their continuous operation. Both of these facts should be taken into careful consideration, especially as to the treatment of these men, and as to the wages paid them—two items which should be uniform throughout the fire-room; I mean by this, that all first-class licensed firemen should receive the same wages; not because a man comes to you with a license, nor because he claims he is first-class, but I mean that he should go on the pay-roll at your stated rate for first-class men in his line, and it is for the water tender, or other higher authority, to determine

1. Abstract of a paper read before the Denver-Colorado Springs convention of the National Electric Light Association on June 6, 1905. Mr. Hancock is connected with the Edison Illuminating Company of Boston.

in the first few days whether or not the man is substantiating himself.

We can now take up the other half of the system, so to speak, of the electrical person. This part of the organization is divided into two parts. We depend on the portion of the latter system to maintain three important items of operation, the most important of which are:

First—A uniform pressure at the feeder terminals throughout the entire system.

Second—The proper and economical loading of machinery under the charge of the division, and,

Third—We hold this division responsible for the welfare of all electrical machinery, which must be, so far as possible, always ready for operation.

I may say that all repairs, except minor ones, in the division are done by outside persons. With the modern stations of today operating lighting and stationary motors and other low-tension apparatus, at the same time delivering alternating current to substations, there is involved a vast amount of apparatus, due to the fact that we must have as much flexibility as possible. We must also have several ways of attaining the same object, as to the delivery of current, in order to safeguard our customers against interruption of service and, incidentally, preserve our reputation for being a reliable concern to deal with. It follows then that we need in a chief operator a man who is absolutely reliable, preferably one who has come up from the ranks and has long since become acquainted with the practical side of operation; one who realizes and instills into the minds of his assistants and men that one of their most important duties is so to manipulate the load with reference to machines to be operated that all units will be loaded to just as near the most economical operating point as it is possible to have them under the existing conditions. He must at all times be in close touch with the chief engineer and, so far as possible, give the steam division advance notice of his probable demand for steam units, thereby giving everybody a chance to be ready, and giving the customer the opportunity to verify our claim that we are at all times ready to supply current. Above all other things, he must have and use good judgment in the selection of his men and the treatment of them, and must conduct his division in a manner that will not only produce satisfactory service, but will be conducive to contentment among his men, and will secure for himself their confidence and respect, which, once secured and properly held, will be a large factor in maintaining what is as nearly as possible ideal operation.

The assistant to the chief operator must be a man who can assist his superior, and to that end he must be thoroughly familiar with all of the electrical apparatus in the division. He must be able to occupy the position of the chief operator when necessary; in fact, he must be a first-class understudy, and must realize the fact, too, or he will lose to some degree the sense of his responsibility. He should circulate among the sub-stations and correct and report any irregularity noticed in machines or operators; in fact, he should keep his superior constantly in touch with such details as do not come immediately under the notice of the chief operator, and in cases of emergency should come at once to the station and be ready to assist if needed.

The heads of watches should be, and necessarily are, men who have come up the line and who understand all the electrical combinations that can be made with machines, switches and lines throughout the system; if they are not, they should not occupy that position, nor should they in any case until we know by actual experience that they have the ability described above.

To these men we accord the highest wages paid in the division, with the exception of those of the chief operator and his assistant, and we make them uniform in all power stations of the system. By this method of making men fit the position before they occupy it, we secure the ability we desire, and after it has been proven beyond doubt by a previous practical experience. It is, in my opinion, a serious mistake to class men alike for the sole reason that they have worked practically side by side on the system for a period of time. I say, pay the man in accordance with what he can deliver to you in brains or manual labor equivalent.

Of the organization to operate storage batteries, I will say I believe that the cheapest man to have at the head is one who is both technical and practical in that line of work, and that he should be possessed of the same qualifications as are necessary in other heads of divisions with reference to handling men. But there is this to add, that it is seldom that men will work in the general line of storage-battery repairs for any considerable length of time, in that such work is not of the sort that attracts the average man, and they do not stay long enough to actually show of what value they might be after a reasonable period of service.

I have refrained from speaking of the head of the generating system and the assistant to that person, for the reason that it seemed to me proper to look over what there was in the nature of organization and operation that the head and his assistant were called upon to look after. I now say that the head of the department has responsibilities.

The very important one is the organization of his department. If that be correct, or as nearly so as conditions will permit, the operating responsibility, broadly speaking, will not seem as serious to the

## National-Interstate Telephone Convention.

Arrangements for the convention of the National Interstate Telephone Association at the Auditorium Hotel in Chicago on June 20th, 21st and 22d are being perfected, and the indications are for an exceptionally large gathering of Independent telephone men. The committee in charge, composed of James B. Hoge and Theodore Gary, states that, besides a large attendance of accredited delegates, a number of men prominent in the financial and promoting end of the business will be present. Tuesday and Wednesday will be given over to the business of the association, and Thursday to sightseeing and social amenities, with an elaborate banquet in the evening.

The program includes a number of papers by men who are recognized as capable of giving the members something of value. A feature of the program will be the reports of five committees which have been considering subjects of vital importance to all operating companies. These committees, composed of 12 men each, will meet on June 19th and complete their reports to be presented to the convention on the following days. The subjects which these reports will treat and the chairmen of the committees are as follows: "Standard Forms of Accounting," H. E. Bradley, Eastern Traffic Association, Philadelphia, Pa.; "Standard Operating Rules and Regulations," A. L. Tetu, Louisville, Ky.; "Standardization of Equipment," Sidney H. Brown, Pittsburg and Allegheny Telephone Company, Pittsburg, Pa.; "Best Methods of Advertising," Thomas Loftin, Indianapolis Telephone Company, Indianapolis, Ind.; "Arrangements Necessary Between Operators and Manufacturers to Protect Independent Companies," Thomas Bromley, Muncie, Ind.

The program for the convention is as follows:

Tuesday, 10 a. m.—Address of welcome, Edward F. Dunne, mayor of Chicago; response, S. P. Sheerin, New Long-Distance Telephone Company, Indianapolis, Ind.; address, "The National-Interstate Telephone Association," James B. Hoge, Cleveland, Ohio; address, "Ways and Means to Make Our Association a Success," Theodore Gary, Macon, Mo.; "Shall the Independent Companies Have an Insurance Company of Their Own?" James S. Brailey, Jr., Toledo Home Telephone Company, Toledo, Ohio; appointment of committees; "Combined Telephony and Telegraphy," Samuel G. McMeen, Chicago.

Tuesday, 2 p. m.—Roll call of states; "Standard Toll Signs," W. F. Laubach, Akron, Ohio; "Value of Telephone Securities," A. B. Greenshields, Philadelphia, Pa.

Wednesday, 10 a. m.—Report of Committees: Standard Operating Rules and Regulations; Standard Forms of Accounting; Standardization of Equipment; Best Methods of Advertising; What Arrangement is Necessary Between the Operators and Manufacturers to Protect Independent Companies? Discussion of Reports and Action by the Convention.

Wednesday, 2 p. m.—Reports of other committees; election of officers; transaction of any miscellaneous business; presentation of new business; adjournment.

From 15 to 30 minutes will be devoted to the discussion of each of the papers and reports. In this way it is hoped to bring out valuable information, especially as it is already known that more than 15 states will have delegates present, thus representing the conditions in all parts of the country.

The manufacturers and supply men will make a large display at the hotel. Already the entire sixth floor and part of the fifth and parlor floors have been engaged for exhibition purposes.

The social and entertainment programme will surpass that of any previous convention. The commitee, headed by P. C. Burns of the American Electric Telephone Company, Chicago, is making its final arrangements while this is being written and nothing will be left undone for the pleasure and comfort of those who attend. The whole proceedings will be concluded with a banquet on Thursday night.

## Telephone News from the Northwest.

The Winona Telephone Company of Winona, Minn., will make extensions to its system in that city.

The Missouri Valley Telephone Company of Mandan, N. D., seeks a franchise in Wilton, N. D., for a local exchange.

The Browerville and Motley (Minn.) Rural Telephone Company has been organized.

The Northwestern Telephone Exchange Company will soon start work rebuilding the exchange at Owatonna, Minn. New exchange offices will be equipped with a large new central-energy switchboard.

The Dakota Central Telephone Company has issued mortgage bonds to raise $500,000 for the extension and improvement of its system through the state.

The Donnybrook (N. D.) Telephone Company has been formed to install a local system.

Work has been started on the telephone system at Granville, N. D., by the Union Telephone and Light Company.

The Northwestern Telephone Exchange Company of Minneapolis is preparing to build a north branch exchange to handle the business of North Minneapolis. This will be the third branch exchange in addition to the main exchange in Minneapolis.

E. M. Sheffield is talking of organizing a rural telephone company at Belmond, Iowa.

W. H. Monroe and others are forming a company to establish a local telephone exchange at Earlham, Iowa.

The Litchville (N. D.) Rural Telephone Company has been incorporated by J. M. Olson and others with $12,000 capital. R.

## Indiana Telephone Items.

A district meeting of the chief operators of the Central Union telephone exchanges of the first district of Indiana was held at the Barnett Hotel in the city of Logansport on June 7th for the purpose of conferring with E. J. Roche of South Bend, service inspector for the district, and incidentally to make arrangements for the annual outing of the operators. Among those present were the Misses E. Lewis of Kokomo, E. Smith of Peru, S. Robinson of Lafayette, C. Laysetter of Wabash and Harriet Heaton of Logansport. Fowler and Frankfort were not represented. The afternoon session was taken up with a discussion of how best to improve the various toll lines. At the close of the discussion the committee decided to hold the next annual outing at Lake Maxinkuckee at a time to be agreed upon by the committee.

The new switchboard for the Independent Telephone Company at Princeton, Ind., is now being installed in the company's new quarters on the second floor of the Ingle Block. The new board has a capacity of 600 single-line telephones with provisions for extension from time to time so as to accommodate 2,000 lines or more. This company is also installing a new outfit of batteries and generators. The officials estimate that at least three weeks will be required to complete the installation of the new equipment.

Patrick Carter, lineman for the Peru Telephone Company, was killed recently by a live wire from a trolley line coming in contact with telephone wires he was repairing after a storm.

Word comes from Washington that M. P. Boone, superintendent of the Home Telephone Company of Peru, has been granted a patent on a common lock-out telephone system.

At a recent meeting of the representatives of Independent telephone companies, held at Fort Wayne, the plan of invasion was left in the hands of a committee consisting of W. L. Moelling of Fort Wayne, Thomas Promley of Muncie, H. P. Sayles of Indianapolis and M. R. Park of Portland. Judge Taylor has rendered a decision to the effect that the contracts affecting the toll-line service which the Independent companies had with the United Telephone Company are good and enforceable. The plan of securing franchises and establishing exchanges in the territory recently acquired by the Bell company through the United company was thoroughly discussed and the committee adjourned to hold another meeting in the near future.

The Home Telephone Company is putting in an exchange in the village of Osceola. Over 100 subscribers will be accommodated to begin with and a toll line is already being constructed from Mishawaka. The placing of an exchange in this village will add quite a territory to the Home company. S.

## Ohio Telephone Notes.

A new voting trust controlling 70 per cent. of the stock of the Toledo Home Telephone Company has been organized to continue until 1910. It is announced that this action was taken to prevent the stock from being picked up by rival interests. A dividend of one per cent. for the quarter was declared, and it is announced that dividends will hereafter be paid on the stock regularly.

The Northern Ohio Telephone Company was organized at Toledo a few days ago by the election of officers, with Willard F. Robison as president. The company was formed to take over the exchanges at Maumee, Perrysburg and Whitehouse. It is probable that other exchanges will be acquired from time to time. It will operate in harmony with the local company at Toledo.

The Central Union Telephone Company has sub-licensed all the exchanges recently taken over in Jackson County, by which about 1,800 subscribers were acquired. Bell instruments have been put in and the wires connected up with the Bell long-distance wires. Jackson, Wellston, Coalton, Oak Hill and Hamden are affected. The exchanges in these places have been consolidated with the Bell exchanges.

The new common-battery multiple switchboard of the Central Union Telephone Company at Massillon was put into operation a few days ago..

Plans are being discussed for the dissolution of the Federal Telephone Company of Cleveland, which is the holding company for 22 Independent companies in Northern Ohio, and has an interest in long-distance lines. The largest creditors are also the largest stockholders in the company. The plan is to exchange the stock in the Federal for that of subsidiary companies or sell the assets to the stockholders at a figure that would pay the debts of the larger concern. It is thought that the business of the smaller companies may be transacted now without a holding company, since a large part of its interests were disposed of in the settlement of the Everett-Moore trouble. The plans, it is thought, will work out to the satisfaction of all concerned if put into execution.

The Bell Telephone Company is arranging to put in a conduit system at Youngstown, it is said, while the streets are torn up in paving.

J. B. Hoge has purchased a controlling interest in the Chagrin Falls Telephone Company at Chagrin Falls. He secured the stock of the late William D. Brewster, who was president of the company, and another block or two that gave him the control. The Bell interests have been after the exchange. C.

## Michigan Telephone Matters.

The Co-operative Telephone Company of Detroit, by a recent decision of the Supreme Court, loses its fight to collect on stock contracts. A large number of people subscribed for stock of this company on a mutual plan at the rate of $50 per share. The stock subscription carried with it a three years' telephone contract. The telephone company won in the Circuit Court, but the decision was reversed in the Supreme Court. The contracts were not signed by the telephone company, and for that reason the court decides that neither party can be held. The Co-operative company is the only Independent company in Detroit, and, while its city business is very light, the long-distance service from other Independent lines throughout the state is considerable.

The Michigan Telephone Company has informed its patrons in River Rouge and Ecorse that a raise of rates will be effected this month. These towns will also have to pay long-distance rates for Detroit and Wyandotte calls. The lines of Delray, River Rouge and Ecorse will be centered at River Rouge and an exchange located there. Retaliation is talked of and an opportunity for an Independent line is opened, it is said.

The Michigan State Telephone Company will install a new exchange at Wyandotte on July 1st. Over 40,000 feet of new wire will be strung. A new exchange will also be installed at Trenton. Both of these towns were worked from the Detroit exchange. W.

## GENERAL TELEPHONE NEWS.

The Rocky Mountain Bell Telephone Company proposes the early construction of a new telephone building at Pocatello, Ida.

The system of the Twin Falls Telephone Company at Twin Falls, Ida., has been purchased by the Rocky Mountain Bell Telephone Company.

Oscar O. Ayres has sold the plant of the Olathe Citizens' Telephone Company at Olathe, Kan., to F. R. Ogg and M. G. Miller, local business men.

The Interurban Telephone Company of West Palm Beach, Fla., has been incorporated with a capital of $25,000 by H. B. Yarborough and associates.

The Southern Montana Telephone Company, capitalized at $5,000, has been organized at Dillon, Mont., and will string wires throughout the Big Hole region.

E. M. O'Brien has resigned his position as resident manager of the Iowa Telephone Company at Des Moines, Iowa. His successor will be E. E. Thompson of Boone. E. E. Tierney takes the latter's place at Boone.

## MANUFACTURERS AND DEALERS.

San Francisco is to have an automatic telephone exchange, the apparatus to be installed by the Automatic Electric Company of Chicago. Articles of incorporation have been filed by the Home Telephone Company and work upon the system has been begun.

R. W. Kemp, F. M. Kemp, W. K. Kise, Will Warren and M. B. Pile have incorporated as the Mutual Telephone Engineering and Supply Company, with a capital of $5,000. The new company is located at Wellington, Kan., and proposes to do telephone construction work in the Southwest and will also carry on hand all kinds of supplies.

The Stromberg-Carlson Telephone Manufacturing Company of Rochester, N. Y., reports having closed contracts for switchboards for the following places: Mt. Branch, Tenn.; Berwick, Pa.; Fulton, Kan.; Fenton, Ia.; Bowbells, N. D.; Folsomdale, Ky.; East Smithfield, Pa.; Elizabeth, N. C.; Washington, D. C.; Cranville, N. D.; Pontiac, Ill.; Macon, Ill.; Chicago, Ill., and Fulton, Ia.

The Chesapeake and Potomac Telephone Company has awarded the contract for the construction of the proposed nine-story telephone exchange, 40 by 150 feet, on Light Street, Baltimore, Md. Two exchange boards, having a capacity of 10,000 lines each, and costing $200,000, will be installed. The building, which will be built by the Herbert A. Weeks Company of New York city, is to cost $400,000.

## Noise-deadening Method to be Tested on Chicago Elevated Road.

An order was passed by the Chicago City Council at its last meeting, presented by the local transportation committee, authorizing the Northwestern Elevated Railroad Company to test a scheme to deaden noise on the elevated road. The scheme which the company proposes will be tried on the Union Loop between Jackson and Monroe streets, and consists in laying 80-pound rail and embedding the ties in crushed gravel, which is also to fill the spaces between the ties.

Considerable objection was raised to the plan by those who thought that the comprehensive noise deadening plans prepared by B. J. Arnold were better and should be tried first. It was argued by the objectors that the proposed device of the company would shut out the light from between the ties and make the streets still darker. One of the aldermen suggested a continuous-rail device for the purpose of deadening noise, but the council decided to let the company try the gravel bed scheme.

## Cylindrical Blue-printing Frame.

The General Electric cylindrical blue printing frame is meeting with considerable success wherever it is installed. Two of the most noteworthy installations in the city of Philadelphia are those at the Electric Storage Battery Company's offices and at the Frankfort Arsenal.

At the office of the Electric Storage Battery Company the General Electric Company's blue-printing machine is regarded as an indispensable piece of apparatus. Since its installation there has been no delay in getting out prints, and the product is of the best and most uniform quality. The frame is used uninterruptedly on all cloudy days, and during the dark periods of the morning and afternoon on clear days. Electric blue-printing paper, which requires eight to 10 minutes to print, is used, so that the total time required to make a batch of prints, including the time allowed for refilling the frame, is 15 minutes. The frame is equipped with 110-volt direct-current enclosed arc lamps.

At the arsenal, the government requires all prints to be positives, and as the prints are made from brown paper negatives the time of exposures is lengthened to about 15 minutes. The arsenal officials state that the frame is satisfactory in its operation, and that they could not dispense with it. Alternating-current lamps of 110 volts are used.

The time required for printing can be materially reduced by the use of more sensitive papers than those employed in the two frames above referred to.

Many large manufacturing companies are to-day depending upon the sun alone for their blue prints, and must, therefore, be severely handicapped in their work. The great advantages secured by the use of the electric blue-printing frame are not as well understood as they might be. Discussion of the subject with manufacturers, engineers, contractors and other users of blue prints about the country would no doubt lead to the installation of many frames.

## New Electrical Repairing Company in St. Louis.

The Southwestern Electric Company of 24-26 South Tenth Street, St. Louis, is a company incorporated some months ago to do repairing of electrical machinery, installing of complete power plants and handling of second-hand apparatus. While the name of the company is comparatively new, a large amount of business is reported as already being done, due in part to the fact of its having absorbed the business and good will of D. J. Pine & Co., and also to the large acquaintance and experience of the individual members of the firm.

D. J. Pine is president of the company and has had 20 years' experience in the electrical business. Mr. Pine was formerly associated with the St. Louis office of the Western Electric Company and later with the firm bearing his name. He is well fitted to look after the construction end of the business, which is under his direct charge.

D. W. Stinson, who has charge of the repair department of the company, is a good practical mechanic in this line of work and has supervised the installation of and repairs on some of the largest electrical machinery in the vicinity of St. Louis. His experience in the electrical field dates back 18 years, 12 of them in the repair department of the Missouri Edison Company.

The office and financial end of the business will be under the care of J. C. Knight, who is secretary and treasurer of the company. Mr. Knight, like his associates, is an experienced electrical man and well qualified to give his department the attention it demands. The company employs none but expert mechanics, guarantees fully all work done. With its adequate facilities it is enabled to give prompt attention to all work, to shipping, etc. The company's location especially fits it to take care of trade in the southwestern, central and western states.

# CORRESPONDENCE.

## Great Britain.

London, May [illegible]

proposed to [illegible]

tween the [illegible]

phone Company [illegible]

House of Commons [illegible]

got to work. The [illegible]

debate it by Sir Robert [illegible]

General Post Office, and [illegible]

tage to be obtained from [illegible]

agreement. Nothing [illegible]

National Telephone Company [illegible]

in 1911 and neither the postmaster-general nor anyone else is bound to buy [illegible]

to sell the undertaking, which on the [illegible]

the company would be legally barred from conveying a single message by telephone. Thus the whole telephonic business of the kingdom would come to a standstill. Foreseeing this the postmaster-general considered that the duty devolved upon him to prevent such an occurrence by making arrangements for a continuance of the service after December 31, 1911, and of the two methods of doing this, viz., erecting a new system or making arrangements to take over the company's undertaking on terms. The view of the postmaster-general was that the latter was the most economical course, as it would thus afford the free expansion of the system in the meantime, which would have been prevented and made impossible had the company merely continued in the position of having to cease to exist in 1911 and with no purchase price for its undertaking. Evidence is to be taken day by day.

The bill which was proposing the establishment of a system of pneumatic dispatch for parcels, etc., in London has met with a not unexpected fate. Without even calling upon the opposition to the scheme to develop its case the committee decided that the proposal should be rejected. The Batchelor Pneumatic Tube Company was engineering the scheme.

Two victories have been scored by the London County Council during the last week. The first was in connection with the tramways, for after many years' trials it has succeeded in inducing a committee of Parliament to sanction tramways over two of the Thames bridges and along the famous Thames Embankment. As a matter of fact the value of the new lines will be seriously discounted from the fact that the proposal to link up the northern and southern systems was rejected. Consequently the effect of the decision referred to above is merely to bring the two systems closer together, for the actual value of the extension to passengers from the south of London is not likely to be very great. What will happen to the project when it comes before the House of Lords for consideration is problematical.

The other matter in which the council has secured something akin to a victory is in connection with the municipal wiring of consumers' premises for the electric light. A bill to this end gave powers to the borough councils to expend money upon this work and also for the hiring out of motors, etc., and this has also been passed by the House of Commons. Great opposition was offered to the scheme, and realizing that the work in question was a trifle beyond the ordinary functions of a local authority the committee placed some rather onerous but nevertheless some sensible and necessary restrictions upon the borough councils in granting the powers sought. Each year the charges are to be so adjusted that all expenditure, including interest and sinking fund, is covered, and further, separate accounts for the wiring part of the undertaking are to be kept in order to demonstrate that this condition is complied with. The decision of the committee, however, still leaves out of consideration the question of depreciation, which, it has been contended, ought to have been included in order to absolutely prevent any possibility of a call upon the rates over the matter.

The differences of opinion which have existed for some time in connection with the working of the Pacific cable will soon come up for settlement, for the long-delayed conference of the colonial states interested in its working will be held toward the end of June. Next week also a deputation will be made to the colonial secretary with the object of seeking a reduction of the rates now charged for the transmission of messages by that route.

The London local authorities are again very much concerned about the frequent breaking up of the streets by electric-supply companies and gas and other companies. The opinion seems to be that the bodies should pay something toward the up-keep of the roads in addition to their share of the rate, which is a very heavy one. A resolution has been passed urging the introduction of a government bill to deal with this point, and a deputation is to be sent to the prime minister. At present the position is that all the companies are working under parliamentary powers which give a compulsory right to break up the streets for the purpose of a public service. It is hardly likely that the difficulty will be overcome in the manner anticipated by the local authorities.

All the electric power bills for London have now been dealt with by the House of Lords committee

[illegible] viz.,

## New York.

[

ownership of the Etowah Development Company, including the control of the waterpower on Etowah River. It is said to be certain that the river power will be developed and 5,000 to 10,000 horsepower will be rendered available. L.

## New England.

Boston, June 10.—Preparations for the Bunker Hill Day carnival in the Charlestown district of Boston, June 17th, are completed and contemplate the repetition of what proved to be one of the most attractive features a year ago, namely, a grand electrical parade in the evening. "A Constellation of Countries" is the theme and floats will be in line representing all the nations of the world. The parade passes over the line of the street railway and the floats are mounted on car trucks, light and power being supplied as they are supplied to the trolley cars. Something over 10,000 electric bulbs of various colors will be employed in the illuminations and electrical effects.

The executive committee of the Massachusetts Association of Electrical Contractors had a meeting this week at Young's Hotel and the plans for the national convention in July were matured and discussed. The chairman, John P. Coughlin, reported that July 19th will be the big day of the convention. Delegates from 37 states have already arranged to be in attendance, it was stated, and the success of the affair is more than assured. At the annual meeting of the Massachusetts association the following officers were elected: President, Frank L. Barnes, Boston; first vice-president, John P. Coughlin, Worcester; second vice-president, W. B. Edgar, Fall River; secretary, Henry D. Temple, Worcester; treasurer, H. S. Potter, Boston; director to national association, S. B. Wetherbee, Boston.

Stone & Webster, owners of numerous trolley lines in various parts of the country, have purcased the Indianapolis and Martinsville railway, comprising 30 miles of track.

The old disused Van Choate Electric Company plant in Foxboro, which claimed so much attention a few years ago, was sold last week to a concern manufacturing mill machinery and cloth. It is said to have cost originally about $500,000 and comprises seven brick buildings and about 15 acres of land. The plant had not been disturbed since it ceased operations as a sequel to the litigation extending over several years. Some of the tools were on the benches as they were left when the plant closed down. The Foxboro assessors placed a valuation latterly of only $150,000 on the plant, but the price paid is said to have exceeded that figure considerably. B.

## Ohio.

Cleveland, June 10.—The Roberts & Abbott Company of Cleveland has made its report on the Toledo and Jackson line. This road will be about 70 miles long and it is proposed to run limited trains to make the trip in two hours, which is better time than the steam roads make. Chair cars will be used on these trains, while the regular trolley cars will be used on the local business.

The Columbus Public Service Company is contemplating the installation of steam turbines in its plant on Mound Street. The only question in the way is as to whether the exhaust steam from them will maintain the hot-water heating system, as with the other style of engines.

Within a short time the Cleveland, Ashland and Mansfield Traction Company will be incorporated. Plans have already been made to construct a line from Chippewa Lake on the Cleveland and Southwestern to Mansfield by way of Ashland, Lodi and some other small places. F. E. Myers of Ashland is one of the active spirits in the promotion of the road.

The Prospect Electric Light and Power Company of Prospect has increased its capital stock from $10,000 to $20,000.

There are rumors that gasoline cars may be provided for the line between Chagrin Falls and Sharon, Pa., and that they will run into Cleveland over the Eastern Ohio tracks.

The William Hall Electric Company of Dayton has been incorporated with a capital stock of $18,000. William Hall, C. A. Hall and others are interested.

The Warren Electric Manufacturing Company of Sandusky has been incorporated with a capital stock of $400,000. The incorporators are E. P. Breckenridge, H. B. Warren, L. G. Read, F. Warren and D. J. Mackey.

According to reports, the Rural Transit Company will be organized to operate a number of 50-horsepower gasoline automobiles from that city to Jamestown, Clifton and Cedarville and another line to Marysville. E. D. Evans is interested in the company.

A proposition has been made to the Toledo council by the Arbuckle-Ryan Company to construct a light plant to be turned over to the city. The plan is to have the city advertise for bids on a 2,000-light plant under specifications to be formulated, and when they are in the company will do the construction work at a price thus ascertained. It will not be necessary for the city to issue bonds under this plan. O. M. C.

## Indiana.

Indianapolis, June 10.—The Home Heating and Light Company of Indianapolis is asking the Board of Public Works for a new franchise under which it may be permitted to charge 20 cents a square foot of radiation for hot-water heating instead of 17 cents, which it is now receiving.

A traction line to connect Indianapolis directly with Huntington, Columbia City and Goshen, and with the Northern Indiana lake region, is proposed by the Huntington, Columbia City and Northwestern Traction Company, which began construction during the last week.

The Indiana Supreme Court has decided that street-railway companies operating within the limits of a corporation are not required to put in an interlocking device at crossings over steam lines. The court makes a distinction in this matter between street-railway companies and interurban companies.

W. D. Dodds, representing parties who are interested in the construction of an interurban road from Marion to Hartford City, has been granted a 50-year franchise through Grant County. The franchise gives the right to haul passengers, mail and express and do a general freight business. The passenger rate is not to exceed 1½ cents a mile.

A meeting of the board of directors of the Wabash and Rochester Traction Company was held during the last week and plans provided for reviving the project. The townships along the route have voted $110,000 in subsidies to it, and there seems to be no reason why the line should not be completed.

Eli Marvin, treasurer of the Indianapolis, New Castle and Toledo Electric Railway Company, announces that agents of the company have obtained options on land for the entire right-of-way of the proposed electric belt railway around Indianapolis. This right-of-way is 100 feet wide and 40 miles in length. Mr. Marvin says that the plans of the company contemplate the actual beginning of work on the belt line within a short time.

The Columbus Street Railway and Light Company will build a power house in Columbus. With the new power house will be combined a central steam-heating plant. S. S.

## Michigan.

Detroit, June 10.—George Y. Wisner, a well-known engineer of Detroit, has been appointed a member of the International Waterways Commission.

It is stated that the Ross Construction Company of Chicago will commence work at once on the new electric railway between Bay City and Detroit. It is known as the Detroit and Bay City Traction Company.

The Detroit, Ypsilanti, Ann Arbor and Jackson electric railway has finally succeeded in effecting satisfactory traffic arrangements with the principal boat lines out of Detroit. It is said that express service will now be given at freight rates for the handling of perishable freight, for points east and south.

The directors of the Detroit, Monroe and Toledo electric railway have authorized extensive improvements, principally that of double-tracking between Monroe and Toledo, and an extension of the line to Adrian, to connect with the proposed extension of the Detroit, Ypsilanti, Ann Arbor and Jackson road, from Ypsilanti to Adrian. It has also been decided to handle freight in carload lots, and the purchase of larger terminal facilities was ordered. Coal will be the principal commodity to be hauled between Toledo and Detroit. Monroe Piers, a summer resort, will also receive improvements; a new electric-lighting plant is one of them.

The conductors and motormen of the Saginaw Valley electric railway went out on a strike on Monday, affecting the Saginaw and Bay City traction lines and the interurban line running between these towns. The men want 21 cents per hour and the "two-turn" system, while the companies present a sliding scale of from 17 to 19½ cents. The companies have made no concessions, while the men have dropped their demands from 25 cents and overtime.

The following companies have been incorporated: American Electric Company, Detroit, capital $2,000; Northway Motor and Manufacturing Company, Detroit, capital $30,000. C. G. W.

## Dominion of Canada.

Winnipeg, Man., June 10.—The construction of a power house in Winnipeg by the Winnipeg Electric Light and Power Company, has been commenced and will be 70 by 130 feet, two stories in height. This will be the terminal of the line in Winnipeg now being built from Lac du Bonnet, and it is thought will be in readiness to deliver power to the railway at the city limits by October next. For some time past the work in connection with the generating plant of the Winnipeg electric street railway at Lac du Bonnet has been steadily pushing ahead. A large plant is being installed there, to be driven by waterpower, and develop energy for distribution in Winnipeg. By October next this will be ready for use. A large cable will carry the current to the city limits, and this will be connected with the big plant, which it has just been decided by the directors of the railway company to erect in Winnipeg.

Winnipeg is to have Sunday street cars, by the terms of an agreement between the council and the company.

The Niagara, Dunville and Erie electric railway has received a charter from the government to build a line from St. Catherines, Ont., to Dunville and Port Dover.

The Cataract Power Company has secured a site in Hamilton on which it proposes to erect a large power house.

St. Thomas, Ont., has taken over the gas and electric-light plant, which will in future be run under municipal ownership.

The Winnipeg Electric Company will extend its line from Winnipeg through St. Boniface, Man., to Birds Hill. Construction has already commenced.

The London, Chatham and Western Electric Railway Company has been incorporated with a capital of $3,000,000 as an electric road, and will build 113 miles of track, from London to Windsor, Ont. The company has been granted permission to sell power, with the consent of the municipal councils interested, and to sell light and heat, with the consent of the people. The road must be operated in four years. H.

## Rocky Mountain States.

Salt Lake City, June 9.—Judge John Porter of Iowa is preparing to establish an electric-railway system at Cheyenne, Wyo. His proposition to leading business men of the city is that if they will raise $20,000 of the fund needed by subscription he will furnish $80,000 for the consummation of the project. The enterprise is being favorably considered by local interests.

Col. Judson Spofford of Lewiston, Ida., has been granted a franchise by the City Council for the operation of an electric street railway, which will co-operate with the independent Lewiston-Grangeville electric road.

Simon Bamberger of Salt Lake City has petitioned the City Council of Ogden, Utah, for a franchise for his proposed electric railway in that city.

The Utah Light and Railway Company of Salt Lake City has been granted a substitute franchise in which its many franchises are extended so that all will expire in 45 years. The franchise applied for by the company was for a 50-year extension.

The City Council of Sumas, Wash., has been asked for a franchise for an electric plant for lighting purposes. H. W. Vanderhoof is the petitioner. G.

Reno, Nev., June 10.—The Washoe Power and Development Company of Reno, Nev., will not meet the 75-per cent. cut in rates made by the Reno Power and Water Company. Several cuts in rates have been made in the last few weeks and neither company at present seems willing to come to an understanding. "We cannot give away our products," said President Humphrey of the Washoe company. "We will turn on our current in a few days and what business we do get will make us a reasonable profit."

A representative of the Truckee River General Electric Company states that a survey is being made for a 20-mile extension of the power-transmission line from Carson City, Nev., through the valley of the Carson River to Anderson.

The Verdi Power and Canal Company is about to install a 20,000-horsepower electric plant at its dam at Verdi, Ariz. The purpose of the plant is to furnish power to the mining camps in the valley.

James J. Burke of Salt Lake, Utah, has the contract for the construction of a power plant on the properties of the Conrey Placer Company. The plant will have a capacity of 500 horsepower.

The Electric Light Company of Virginian, Nev., is planning to extend its plant by an addition to the sub-station. When the extension is completed the entire plant will be under one roof. A.

## Pacific Slope.

San Francisco, June 9.—The Ocean Shore railroad has been granted the application for rights-of-way between Santa Cruz and San Francisco. Secretary Bert Corbett of the company says that construction work will be commenced immediately at the Santa Cruz end of the line. The road is to be run by electricity, but the franchise was granted for a steam road so as to bring the line into that classification under the state law which grants certain privileges to steam roads. The attitude of the Southern Pacific steam road toward the progress of the new road is shown by the fact that it has brought suit in the name of the Coast Line railway to condemn rights-of-way on three pieces of property near the beach upon which the Ocean Shore road has secured options for a depot.

An electric fire-alarm system is about to be installed at Ukiah, Cal. Electric fire alarms are meeting with considerable favor throughout the western cities, and it is being proved that they are very successful in minimizing the loss of property by fire.

The San Joaquin Light and Power Company has

been incorporated at Los Angeles, Cal., with a capital stock of $1,000,000. The directors are W. G. Kruckhoff, K. Cohn, V. Hass, H. W. Mckeens and others.

At a special meeting of the Battle Creek Power Company, held June 5th, it was decided to authorize an issue of 30 year bonds in the sum of $1,000,000. It is the intention to install a hydro-electric plant for the transmission of power from Battle Creek in Shasta County to the mining districts and towns in Northern California.

Bonds are to be issued by the San Luis Obispo Gas and Electric Company for the erection of a new electric plant at San Luis Obispo, Cal. W. F. Boaman, president of the company, and A. M. Hunt, electrical engineer, are making arrangements for the new plant. The building will cost about $15,000.

The Edison Electric Company of Los Angeles is buying a right of way through the northern part of the Tolnea tract for its power line, running between Kern River and Los Angeles. Steel towers are to be used instead of poles.

The Edison Electrical Company has a large force of men employed in rebuilding the light and power system at Whittier, Cal. The secondary system now in operation will be replaced by a primary system of 220 volts. The transformers at the distributing station will be dispensed with and instead there will be a system of transformers placed throughout the city.

E. H. Liebe of Clarkston, Wash., has asked the city authorities of Spokane for a franchise for the construction of a street railway.

The streets of San Jose, Cal., will soon be free of telephone and electric-light wires in the business center. The city authorities have compelled the companies to place the wires underground. A.

## PERSONAL.

William von Puhl, superintendent of the electric department of the Cincinnati Gas and Electric Company of Cincinnati, Ohio, has resigned and will go south to enter business.

Professor E. B. Huntoon, it is announced, will succeed Prof. J. C. Kelsey, who resigned recently from the position of professor of telephone engineering at Purdue University, Lafayette, Ind.

Edward A. Leslie, general manager of the Kings County Electric Light and Power Company, died on June 5th at his home, 262 Hancock Street, Brooklyn, of pneumonia. He was born in Harrisburg, Pa., in 1849.

Professor Charles P. Matthews has been selected for the head of the department of electrical engineering at Purdue University, Lafayette, Ind., to succeed Prof. W. E. Goldsborough, who has severed his connection with Purdue some time ago.

The new executive committee of the Chicago branch of the American Institute of Electrical Engineers recently re-elected Mr. K. B. Miller chairman. Mr. H. R. King of the Western Electric Company was elected local secretary. Mr. Miller, as members of the Institute are aware from his previous fulfillment of the office of chairman, will perform his duties in his usual thorough and painstaking manner. Mr. King is one of the leading engineers of his company and will no doubt carry out his part of the work in the efficient manner of his predecessor, Mr. P. Junkersfeld.

W. S. Heger has recently been made assistant to the vice-president and general manager of the Allis-Chalmers Company. He was born in 1857 at Fort Simcoe, Wash., and received his education both in this country and Europe, spending seven years in Vienna, Austria. After receiving the degree of M. E. at Stevens Institute of Technology in 1879, Mr. Heger's business career began in the mechanical drafting room of the Edgemoor Iron Works. In 1885 he went into business upon his own account as a contractor and electrical engineer, and later became sales agent and constructor for the Edison Company for isolated lighting in the states of Delaware, Maryland, the Virginias and the Carolinas. In 1889 he was sent to San Francisco as district manager for the Pacific Coast territory for the Edison Company and for the Edison United Manufacturing Company. He built up the organization there, which exists today under the General Electric Company, and established a large and successful business. In 1892 he accepted the place of general manager of the Wilmington City Railway Company, Wilmington, Del., and spent three years there rebuilding and operating the road. Returning to the Pacific Coast again in 1895, he became the district manager for the Westinghouse Electric and Manufacturing Company, with headquarters in San Francisco. He built up a strong selling organization and made a wide market for the products of his own company and those of the Sawyer-Man Com-

W. S. HEGER.

pany. During Mr. Heger's [illegible] the Pacific Coast were [illegible] of the many unbonded [illegible] met. The meeting of a number of the engineers in the [illegible] those long-distance [illegible] valuable part of his experience. Mr. Heger is [illegible] with the Allis-Chalmers Company [illegible] the general offices in Milwaukee.

T. M. Haines, second vice-president and general manager of the Northern Texas Traction Company, owning the interurban line between Fort Worth and Dallas, Texas, and the street-railway lines in Fort Worth, died on June 1st in Fort Worth. He was stricken with typhoid fever on May 1st. Mr. Haines was a well-known and well-liked civil and electrical engineer and drew the plans and superintended the building of the interurban road he managed. He also built a number of electric roads in other parts of the country, being for some time interested with the Bishop-Sherwin syndicate of Cleveland. He built the present electric lines in Para, Brazil, and in Caracas. Prior to going to Fort Worth he was for a time with the Northern Pacific railroad. Mr. Haines was born in Pennsylvania 45 years ago, where he studied, and subsequently he graduated from the Massachusetts Institute of Technology. His remains were taken to Boston. He is survived by his mother and two brothers.

## ELECTRIC LIGHTING.

M. Focht of Kansas City, Mo., it is reported, contemplates erecting an electric-light plant at Springdale, Ark.

The Lawrence Electric Light Company of Lawrence, Kan., has been incorporated with a capital stock of $40,000.

The city of Ozark, Mo., has granted a franchise to S. E. Branson to erect an electric-light plant and operate it for 20 years.

The New Valley Junction Water and Light Company of Valley Junction, Iowa, has been incorporated with a capital stock of $12,000.

An electric-light plant is about to be installed in Dayton, Iowa, and one of those interested in the project is H. E. Nelson, M. D., of Dayton.

J. L. and W. R. Page and others have incorporated as the Natural Gas, Electric Light, Heat and Power Company of Olean, N. Y., with a capital of $50,000.

The city of Monticello, Ga., has voted affirmatively on the proposed $30,000 bond issue for the construction of electric-light plant, waterworks and sewerage system.

Conway Springs, Kan., a thriving little city in the southern part of the state, is considering a proposition made by Bert Strong to put in an electriclight plant.

The electric-light plant at Anadarka, Okla., constructed by the El Reno Light and Power Company and costing $11,000, has just been put into operation. It will be run in connection with the waterworks.

The Columbus (Texas) Light Company has been incorporated with $10,000 capital stock by J. W. Towell, Carey Shaw and Josiah Shaw to operate an electric-light and power plant.

By the terms of an ordinance just passed by the Chicago City Council the local elevated railways are required to place an illuminated street sign at each end of the platform at each station and one sign in the center of each platform to be placed under electric lights.

A recent dispatch from the City of Mexico says: "The Mexican Light and Power Company, a Canadian concern operating here, has purchased all the light and power plants in this city. This is believed to be the biggest individual deal in the commercial history of Mexico. The amount paid the Mexican Gas and Electric Company is $5,000,000 and the Ildefonso company $4,000,000 in stock and $2,000,000 in bonds are given for its property, the total figuring $11,000,000. The total expenditures of the Mexican Light and Power Company, when work is completed, will be $40,000,000."

The proposition to light the streets and alleys of Chicago through means of the waterpower to be developed by the Chicago Drainage Canal at Lockport, Ill., is again up for consideration by the council. The proposition to generate electricity from the use of the Lockport waterpower was considered by the last council, but negotiations were suspended because the city insisted upon receiving the electricity at cost, whereas the canal board wanted a profit. City Electrician Carroll is quoted as saying that "There is some 20,000 horsepower there, while we now use only 6,000, but we cannot be expected to pay more than cost, because that is what the city is paying now for its own electricity. If the city can make arrangements with the canal board it can be made the best lighted city in the world, and well-lighted streets and alleys are one of the greatest assurances against crime."

## ELECTRIC RAILWAYS

[illegible]

entry.

[illegible] nated by the traction companies and sent through St. Louis over the steam lines. While rates are rather demoralized on western lines, the traction [illegible] interline business and have met with considerable success.

A new 25-mile electric railway along the Hudson River from Albany to Catskill is being planned by the Upper Hudson Electric and Railroad Company. Headquarters are at Newburg, N. Y., the capital is $500,000 and the directors are Eugene Wolf of Athens, N. Y., Luke F. Gillespie of Newburg and F. J. Curnick of New York.

A certificate of incorporation has been issued to the Oran Electric Railway Company of Oran, Mo. The company is capitalized at $50,000 and proposes to build an electric road 10 miles in length, running from Oran to Rockview, the entire line to be within Scott County. The incorporators are headed by M. G. Gresham.

The Kansas City, Stranger Valley and Western Railway Company of Kansas City, Kan., was chartered on June 8th. Its capital stock is $100,000 and its object is to build an electric line from Kansas City to Topeka, through Wyandotte, Leavenworth and Jefferson counties. The incorporators are W. Laming and S. J. M. Naughton of Tongaxoie, Kan., W. A. Adams and M. M. Gallagher of Easton, Kan., and James T. Manning, Charles Grover and E. M. Lamkin of Kansas City, Mo.

The Havana Central Railway Electric Company has been organized in New York by Canadian and American capitalists. The capital stock will consist of $5,000,000 in stock and $10,000,000 in bonds, but one-half the latter will not be issued for the present. The company intends building 120 miles of electric railway radiating from the city of Havana, and taking in 30 towns. One line will extend across the island to Del Rosario. Edwin Hanson of Montreal will probably be president.

The directors of the new electric road to North Adams, Mass., expect to have work begun on the line within a short time and to have the road in operation within the year. In securing the right-of-way they have been able to purchase at reasonable prices, except in a half-dozen cases, and in these, acting under the state charter, condemnation proceedings have been begun and an appeal has been made to the state Board of Railroad Commissioners, which will give a hearing and fix the damages to be paid the land owners who refuse to sell at what the directors consider a reasonable price.

Articles for the incorporation of the Green Bay (Wis.) Traction Company, with a capital stock of $1,000,000, were filed recently. A. M. Murphy, W. P. Wagner and B. L. Parker are named as the incorporators. This is said to be a step in the contemplated plan of consolidating the interests of the Fox River Electric Railway and Power Company, operating the city street-railway line and the lines to De Pere and Duck Creek, and the Knox Construction Company, operating the Green Bay-Kaukauna electric road. It is the intention to make extensive improvements in the lines already in operation and to construct and operate other lines, among them a road from Green Bay to Manitowoc.

The Washington, Baltimore and Annapolis Electric Railway Company, which has under construction a double-track electric railway from Baltimore to Washington, and which will convert to electricity the old Annapolis and Elkridge railroad, which it owns, has applied to the City Council in Baltimore for a franchise to permit its cars to enter the city. The Baltimore Terminal Company has been organized in the interest of the railway, and it is proposed to establish a terminal near the center of the city. The company has a private right-of-way for the entire distance and will be able to make high speed. It is said that there will be 27 miles of straight track in the 31-mile line between the limits of the two cities, and already more than 60 per cent. of the grading has been completed. John Sherwin of Cleveland, who is associated with T. Bishop in the Baltimore and Washington line, is vice-president of the Northern Texas

Traction Company. Others who are in the latter company from Cleveland are Messrs. Charles E. Adams and John Masterton.

## TELEGRAPH.

The Pacific Commercial Cable Company announces a reduction of 20 cents a word in the rate to Japan, to take effect on July 1st. The new rate will be $1.21 a word from San Francisco to Tokio.

George G. Ward, general manager of the Commercial Cable Company, sailed on the Campania for England on June 10th to complete, it is said, the contract with an English firm for laying a new Atlantic cable. This cable will be laid by the shorter route and will be of larger diameter than any cable at present owned by the company.

## SOCIETIES AND SCHOOLS.

The degree of B. S. was conferred by the Massachusetts Institute of Technology, at its commencement exercises this year, upon 244 graduates, and the degree of M. S. upon 18.

Owing to the conflict of dates with other societies it has been decided to alter the dates of the Erie convention of the International Association of Municipal Electricians to August 23d, 24th and 25th. Some of the plans for the entertainment of the delegates will be different from any had in the past. Papers to be read will be of importance and valuable in the conduct of the business of the association's members. Frank P. Foster of Corning, N. Y., is secretary.

## PUBLICATIONS.

A bulletin describing the battery equipment of the Frontier Telephone Company's exchange in Buffalo has been issued by the National Battery Company of Buffalo. The bulletin is well illustrated with pictures of the interior of the exchange. This installation was described in the Western Electrician last week.

Candee potheads and Okonite telephone and telegraph wires, for which the Central Electric Company of Chicago is agent, are described in a neat circular sent out by the company. The potheads are designed to prevent the destructive attack of moisture upon paper-insulated cables.

The Jeffrey Manufacturing Company of Columbus, Ohio, has recently issued an attractive bulletin on Jeffrey portable outfits for excavating and screening. The bulletin is well illustrated with fine half-tone cuts, showing the various applications of this type of machinery. Another bulletin is upon the subject of pulverizers for crushing coal, stone, etc.

Rossiter, MacGovern & Co. of Jersey City, N. J., who deal in all kinds of second-hand electrical apparatus, have issued a new catalogue of the machines they have available, which is very complete. The company guarantees all apparatus which it sells. It has extensive shops at Jersey City for the repair of machines, which are all thoroughly overhauled.

The American Steel and Wire Company of Chicago has issued a treatise on the use of sulphate of iron and copper in water purification. The pamphlet contains reports of experiments conducted at Anderson, Ind., by government experts. In the drawing of wire the steel is first dipped in acid to take off the scale. This, of course, produces a large quantity of sulphate of iron, which is therefore a by-product of wire mills. The American Steel and Wire Company produces much of the sulphate in its various mills.

The Cincinnati Milling Machine Company of Cincinnati has just issued a new treatise on tool-room grinding and grinding machines. This book contains considerable valuable information on the subject of cutter and tool grinding. Part 1 is devoted to the company's No. 1 Universal cutter and tool grinder. Part 2 is devoted to No. 2 grinder, which is a new one, and covers a field for which there has been no grinder thus far. The numerous illustrations show exactly how to handle the work, and the descriptions in connection with them give data on cutter grinding, no matter what machine is used. The book is sent free to those interested in this subject.

Words can hardly do justice to the handsome catalogue which has just been issued by the Wellman-Seaver-Morgan Company of Cleveland, Ohio. The book has 103 pages, 8¾ by 12 inches in dimensions. It is devoted to ore and coal-handling machinery, and a glance through its pages will reveal some of the very finest evidence of the printers' and engravers' skill. Many of the pictures take up a whole page, and they illustrate admirably the apparatus manufactured by the company. In these days of high-class advertising literature, handsome catalogues are common, but those which can equal this in the quality of work and the arrangement of the material are few and far between.

As brought out by Mr. John Craig Hammond at the Denver-Colorado Springs National Electric Light convention, the best kind of advertising is opportune advertising. The importance of this fact is evidently recognized by the Crocker-Wheeler Company of Ampere, N. J., for it has issued a new pamphlet upon "The Vital Subject of Lighting." The cover is adorned with a picture of a typical broncho-busting scene, and the picture will at once attract the eye of those who attended the convention, and saw the broncho busting there. As with electrical men, so it is with the broncho buster—the vital subject is "lighting." The pamphlet is devoted to alternating and direct-current generators for lighting.

## MISCELLANEOUS.

The amount of electricity sold in the London districts by the County of London Electric Supply Company during the first quarter of 1905 is estimated to realize about $209,000, which compares with $189,500 for the corresponding period of last year.

William Marconi sailed for Europe on June 10th on the Campania, and announced his intention of trying to keep the vessel in communication with both shores each day of the voyage, this feat having been accomplished for three days on a recent trip, it is reported.

The Western Union Gas and Electric Company, with headquarters at Aurora, Ill., is the name of a new lighting company formed by the consolidating and merging of the Joliet Gas Company, the La Grange Gas Company and the Elgin-American Gas Company.

A company has been formed to run a service of public electric buses between points in Malta not yet covered by the new street railway. For public service there will be a 20-horsepower 17-seat single-deck bus, four 24-horsepower 36-seat double-deck buses, and one 24-horsepower lorry.

For demonstrating the possibility of sustaining without harm a high-frequency high-tension current Prof. Elihu Thomson of Lynn, Mass., permitted a current at 500,000 volts to pass through his body, it is said. This was done without his experiencing the slightest physical discomfort. Professor Thomson adjusted a special apparatus to his body and a high-frequency current was used.

In connection with the telephone service which the Long Island railroad is installing, the railroad will begin road inspection by emergency crews of four men, who will constantly patrol the road in gasoline-motor cars running on the tracks. When the electrical road opens there will be two of these crews, which will keep in touch with headquarters by telephone. In particular they will look after the transmission lines. The automobiles weigh 750 pounds, and will carry complete kits of necessary tools.

The General Electric Company at Schenectady, N. Y., says the World's Work, employs about 800 men who devote much of their time to developing new ideas. It spends $2,500,000 a year in this development work. The Westinghouse Companies do the same thing; so does every progressive manufacturing concern of any consequence in the United States. And it is these unknown men, grappling with the every-day, practical problems of great manufactories, who make most of the inventions of immediate commercial value.

The Census Bureau is completing the first of the quinquennial census of the manufactures of the various states under the new provision for the compiling of these figures every five years instead of at 10-year periods as formerly. Michigan is the first state for which complete returns have been received. There are 14 establishments in the state for the manufacturing of electrical machinery, apparatus and supplies, with a combined capital of $413,732, under the control of eight persons. Of the capital stock $1,300 is invested in land, $6,500 in buildings, $81,847 in machinery, tools, etc., and $324,085 in cash and sundries. They carry on their pay rolls 60 salaried employes and give employment to 529 persons. The combined value of the product for the year, including custom and contract work, is placed at $702,102.

## TRADE NEWS.

The Nebraska Electrical Company and the Neally Bros. Company have consolidated their business at 312 South Twelfth Street, Lincoln, Neb.

William T. Spranley, L. C. Reed and others have incorporated as the Hattiesburg Electric Supply Company, Hattiesburg, Miss., with $10,000 capital stock.

H. L. Canfield, treasurer and general manager of the Delphos Electric Light and Power Company of Delphos, Ohio, has secured a complete franchise for 25 years, and a modern electric-light and power plant will be erected. Modern equipment will be used throughout. The plant will supply New Straitsville, Ohio and Delphos, two miles apart, and will be located at the former place. Bids for boilers, engines, arc lamps, poles, wires, etc., will be received by Mr. Canfield of Delphos.

The Toctos Medical Company, No. 1 Corso Romana, Milan, Italy, wishes catalogues and prices from American manufacturers of electric apparatus for medical use.

The Capital Electric Company of Richmond, Va., has been organized with $1,500 capital stock to do a general electric contracting business for the installation of power, light and heat plants, etc. F. J. Whybrew is president, J. J. Tresnon secretary, and W. B. Jennings treasurer.

The Chicago office of the Reeves Engine Company, which is under the management of Joseph B. Hall, has recently been moved from 1612 Monadnock Block to 805 Ellsworth Building. The telephone number remains the same. Mr. Hall reports the western business of his company as very satisfactory.

Sealed proposals will be received at the office of the supervising architect, Treasury Department, Washington, D. C., until July 11th for the installation of a conduit and electric wiring system for the court house and postoffice at Lincoln, Neb., in accordance with the drawings and specifications, copies of which may be obtained at the above office or at the office of the superintendent of construction at Lincoln.

The bureau of supplies and accounts, Navy Department, Washington, D. C., is soliciting bids until June 27th for furnishing eastern navy yards with the following: Schedule 301, motors, generating sets; schedule 302, generators; schedule 303, incandescent lamps, wire, rheostats, ebonite, mica and miscellaneous electrical supplies. Blank proposals, etc., can be obtained on application to the bureau at Washington or to the navy pay office in New York.

The Ingersoll-Sergeant Drill Company and the Rand Drill Company have been united into a new company called the Ingersoll-Rand Company. The new corporation was formed under the laws of New Jersey with a capital of $10,000,000, of which $5,000,000 is preferred stock and the balance common. This is a union of valuable patents and of expert engineres of large experience in this special line of work. Improved machinery and better service will result. The factories of the two companies are located at Phillipsburg, N. J., Easton, Pa., Tarrytown, N. Y., Ossining, N. Y., Painted Post, N. Y., Thirty-fourth Street, New York city, and Sherbrooke, Quebec. They will all be operated. The officers of the Ingersoll-Rand Company are as follows: President, W. L. Saunders; first vice-president, George Doubleday; other vice-presidents, Jaspar R. Rand, John A. McCall, J. P. Grace, W. R. Grace, George R. Elder; treasurer, W. R. Grace; secretary, F. A. Brainerd.

The many friends in the West among the electrical people of George W. Beltzhoover, formerly special passenger agent of the Pennsylvania railroad, with headquarters at Chicago, will be interested to know that Mr. Beltzhoover has been made district passenger agent, with headquarters still in Chicago. The appointment is one well deserved, as Mr. Beltzhoover has been with the Pennsylvania railroad for 29 years, beginning his career as a messenger boy at the Pittsburg offices of the company. The position which he has recently been given is a new one, and it was created with a view of pursuing a still more aggressive policy in the passenger affairs of the Pennsylvania railroad. Mr. Beltzhoover's extended railroad experience and business forcefulness, to say nothing of his courtesy and ease in making and holding friends, are qualifications which fit him eminently for this newly created position. Those who know Mr. Beltzhoover best prophesy for him a career as a rapidly rising railroad man.

Friends throughout the West of the popular railroad man, L. F. Vosburgh, will be interested to know of his recent promotion and appointment to the position of general western passenger agent for the Lake Shore railroad. For quite a number of years Mr. Vosburgh has been on duty, in command of the Lake Shore ticket office in Chicago, at the corner of Clark and Monroe streets, filling the position of general agent for the Lake Shore railway. Mr. Vosburgh has a large acquaintance, not only among the electrical people, but the general public of the West. Theatrical people, politicians, merchants and other high-class patrons of the passenger department of the Lake Shore railway are among his acquaintances. His work with the electrical people of the West has been largely along the line of handling electrical "specials," and in this capacity he has always proved himself not only courteous, but a thoroughgoing executive and master of the railway passenger business. Mr. Vosburgh's headquarters have been changed from the Shore railway at the La Salle Street depot, Chicago, city ticket office to the general offices of the Lake

An error in relation to the cut illustrating Fort Wayne prepayment wattmeter on page 807 of the Western Electrician of June 10th crept in after the press proof had finally been passed upon, the first two cuts being accidentally transposed by the printer. Fig. 1 is an outside view of the type K prepayment wattmeter, but the type W is shown instead, while type K is shown over the caption line belonging to type W. Fortunately the type letters of the two instruments show upon the faces, and it is hoped from this fact that no confusion has arisen over the error.

## BUSINESS.

The Pleasantville Electric Company of Camden, N. J., has been incorporated by Frank C. Mercer and others, with a capital of $125,000.

The Western Electric Company of Chicago reports a continuance of brisk trade in Sunbeam lamps. Its sales of Sunbeam lamps, for this season of the year are unusually large, which is undoubtedly due to the uniformly high quality of the lamp.

The Chicago House Wrecking Company, Chicago, states that its purchases from the St. Louis World's Fair enable it to furnish almost anything in the electrical-supply line. In addition to wires and cables, incandescent lamps and instruments, it can furnish almost everything used in electrical construction work, and will be pleased to send its new and complete catalogue to those interested.

The [illegible] Electric Company, of [illegible], has been incorporated by [illegible] and others, with a capital of $[illegible]. The purpose of the company is to [illegible] and sell electrical apparatus, and to do a general electrical business.

The Electric Service Supplies Company, of Philadelphia, Pa., has been awarded the contract for furnishing the electrical apparatus for the new Masonic Temple at Broad and Filbert streets, Philadelphia. The contract includes the wiring of the building for electric lighting, motor service, etc. The building will be completed in the month of May next. The Electric Service Supplies Company is also furnishing the electrical apparatus for the new Lafayette Building, which is being erected by Mr. John Wanamaker, during the year 1905. It is [illegible] ...ter of 100 feet high and will be equipped with two 150-kw. 60-cycle, 2,200-volt alternating current generators, also winding tools for the armature and [illegible] frequency. The company reports a very heavy increase in the demand for its alternating current ceiling fans, the latest being [illegible] the utmost to supply the demand at present.

Users and buyers of Bell and Home telephones, switches and DeVeau telephones in the West will be interested to know that the offices and stockrooms of William P. Crockett, well known as western agent of these companies, have lately been moved to much enlarged quarters in the same building formerly occupied at 165 South Canal Street, Chicago. The entire ground floor and basement will be occupied and the stock carried has been materially added to. Mr. Crockett, who for the last five years has represented the manufacturers of this apparatus in his present capacity, took hold of this agency when the business in this section of the country was comparatively undeveloped, and the wide sales of these goods in this territory at present speaks emphatically for his energy and enterprise. Mr. Crockett was recently elected as director of the [illegible] ...tion.

[illegible] ...and Lima Traction Company. The order called for 2,000 40-foot, 7-inch poles, which were shipped in less than three weeks. That, the company says, is [illegible] ...portant orders for Michigan poles. A novelty which this company manufactures is a small special wrench [illegible] ...wrench is a great convenience in installing this class of apparatus.

# ILLUSTRATED ELECTRICAL PATENT RECORD.

*Issued (United States Patent Office) June 6, 1905.*

701,457. Apparatus for Treating Liquids. Leon Dion, New York, N. Y., assignor to the Americus Electro-Hermatic Company, New York, N. Y. Application filed May 24, 1904.

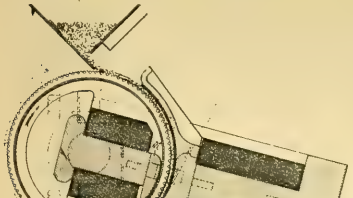
Electrodes arranged within a receptacle or reservoir above and below the entrance of the inlet-pipe are used for supplying an electric current to the liquid.

701,464. Electric Motor-controlling Device. Arthur E. Handy, Providence, R. I., assignor to the Rhode Island Elevator and Machine Company, Providence, R. I. Application filed September 19, 1904.

An electric motor having a double winding and two commutators is supplied with an auxiliary switch and an electromagnet controlled in its action by the movement of the auxiliary switch to throw the windings on the armature from multiple to series and vice versa; the switch can only be made to make or break the connections to the magnet when the motor is at rest.

701,491. Facsimile Telegraph Apparatus. Herbert R. Palmer, Cleveland, Ohio, assignor to the Electrograph Company of America, Cleveland, Ohio. Application filed February 25, 1901.

In a facsimile telegraph instrument are a power mechanism for frictionally driving the instrument, mechanism for retarding the instrument, a device for controlling the retardation operated by the power mechanism, and an electric device for causing the application of the power to the retarding mechanism.



NO. 791,494.—APPARATUS FOR MAGNETIC SEPARATION.

701,492. Dynamo Electric Machine. Charles A. Parsons and George G. Stoney, Newcastle-upon-Tyne, England, said Stoney assignor to said Parsons. Application filed April 18, 1904.

A continuous-current dynamo, comprising field magnets having pole-pieces separated by air gaps or non-magnetic bridge pieces and a main shunt field winding, has a series winding uniformly surrounding the armature having its axis in the line of commutation. The number of ampere turns in the series winding exceeds the number of ampere turns in the armature by at least one and one-half to three times.

701,494. Apparatus for Magnetic Separation. Clarence Q. Payne, Stamford, Conn., assignor to the International Separator Company. Application filed February 2, 1903.

A transversely laminated separating carrier is provided with magnetizable laminæ whose edge faces are provided with projecting portions which create a series of point and line dispersions of the flux density on the surface of a cylinder. Means for magnetizing the cylinder are provided. (See cut.)

701,528. Sewing-machine Motor. Homer J. Young, Toledo, Ohio. Application filed February 20, 1904.

An electric motor comprising a rotor is mounted concentrically upon the shaft and has driving connection with the latter. A toothed, rigid with the rotor and arranged concentrically within the latter, carries a stator mounted concentrically within the rotor, with means for holding the stator against rotation.

701,537. Barrel-head Planer. Gustave Cluthe, Cincinnati, Ohio. Application filed December 27, 27, 1904.

The planer consists of an electrical motor, having handle for guiding it and a knife disk secured to the end of the motor shaft, the disk being rounded upon its edge, and having a series of radial slots. Knife-blades are secured in the slots and project beyond the face of the disk, the amount of projection increasing toward the circumference.

701,547. Vapor Electric Apparatus. Samuel Ferguson, Schenectady, N. Y., assignor to the General Electric Company, Schenectady, N. Y. Application filed January 18, 1904.

In a vapor electric apparatus is a pivoted member for supporting a rectifier or similar vapor electric device. A magnet having an armature, pivoted to the member, is provided with an exciting circuit. Means actuated by the rocking or tilting of the pivoted member open the exciting circuit.

701,555. Process of Stripping Tin. Henry W. Hemingway, Walthamstow, England. Application filed October 29, 1902.

A process for stripping tin from tinned iron, recovering the tin and revivifying the exhausted stripping liquor consisting in immersing the tinned iron in a bath composed of a solution of persulfate of iron slightly acidified. This is treated electrolytically for the purpose of depositing the tin in a metallic state upon any suitable cathode.

701,556. Trolley Wheel. John Hensley, Huntington, Ind. Application filed July 20, 1904.

A lubricating device in connection with the trolley wheel is the feature of novelty.

701,562. Electric Flash Sign. John C. Lion, Philadelphia, Pa. Application filed February 20, 1905.

Associated with a number of contacts forming circuit terminals is a revoluble drum carrying interchangeable bars. Each of the bars is angular in cross-section and provided with a face arranged to follow the contour of the drum, the remaining web being cut away at intervals to form tongues for engaging the contacts.

701,572. Bipolar Vacuum Electrode. Earle L. Ovington, Boston, Mass. Application filed March 6, 1905.

A bipolar vacuum electrode for therapeutic treatment is of such a construction that the electric circuit through the electrode may be completed by the body of a patient.

701,573. Audiphone Instruction Apparatus or Set. Herman G. Pape, New York, N. Y. Application filed November 9, 1904.

An audiphone instruction set includes a primary circuit, a teacher's receiver in the circuit, an earpiece and an induction coil paralleled in the primary circuit. A secondary circuit includes the secondary winding of the induction coil, an earpiece in the secondary circuit and provision for cutting either the first-named earpiece or the induction coil out of circuit, one independently of the other.

701,574. Automatic Railroad Signaling. Frank P. J. Patenall and George H. Dryden, Baltimore, Md. Application filed March 13, 1905.

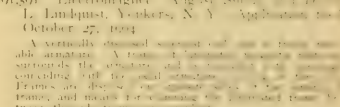
In a railway signal system are combined a signal mechanism adapted to indicate danger, caution and clear and controlling mechanism for the clear and caution positions, one operated from the home and the other from both the home and a distant station, whereby upon failure of one the other will perform its functions.

701,582. Automatic Starting Device for Vapor Apparatus. Robert E. Russell, Schenectady, N. Y., assignor to the General Electric Company. Application filed March 16, 1904.

Combined with a vapor rectifier having main electrodes and a starting electrode are a storage battery, a resistance and a starting and controlling switch for starting the rectifier through a local circuit including the resistance and battery, and for then eliminating the resistance [illegible] ...and placing the latter [illegible] ...rectifier.

701,591. Electromagnet. August Sm[illegible] ...Lockport, Yonkers, N. Y. Application filed October 27, 1904.

A vertically-disposed [illegible] ...able armature. A [illegible] ...surrounds the [illegible] ...extending [illegible] ...Frames are [illegible] ...frame, and means [illegible] ...tween the side frames [illegible] ...



NO. 791,656.—TELEPHONE REPEATER.

791,594. Electromagnetic Block System. Guion Thompson, Two Harbors, Minn., assignor to the Thompson Safety Appliance Company. Application filed May 16, 1901.

Combined with a series of [illegible] ...cuits, each including a source of electricity, [illegible] ...of an electromagnet, [illegible] ...contact adapted to be closed by the [illegible] ...net is energized and a normally [illegible] ...contact adapted to be opened by the [illegible] ...other of the circuits when the last-named magnet is energized.

791,603. Electrical Contact Device. Henri Bo[illegible] ...Paris, France, and Cipriano Portilla, Madrid, Spain. Application filed July 10, 1902.

A current-taking support for [illegible] ...and the like is provided with a base [illegible] ...having a grooved edge, and also [illegible] ...taking rods held loose in [illegible] ...grooves.

791,633. Trolley. David Lippy and Abraham Neodemus, Mansfield, Ohio, assignors of one-third to George Moorhouse, Mansfield, Ohio. Application filed November 7, 1904.

Divergent arms fixed to the trolley harp keep the wheel upon the wire.

791,635. Electrode for Primary Batteries. Theodor Mann and Carl Goebel, Duisburg, Germany. Application filed January 21, 1903.

An electric primary battery is [illegible] ...carbon electrode having a working surface which is greater than the surface of a [illegible] ...dimensions as the electrode. A zinc [illegible] ...acid-proof insulators that reduce its working surface, is a special feature of the device.

791,655. Telephone-current Reinforcer or Relay. Herbert E. Shreeve, Newton, Mass., assignor to the American Telephone and Telegraph Company, Boston, Mass. Application filed July 8, 1904.

Telephone-current retransmitting and reinforcing apparatus comprises a magnet constituting an initial source of force. A receiving or magnetization-varying coil surrounds the pole of the magnet to vary the [illegible] ...initial field. A veritable-resistance transmitting medium and a magnetic connection [illegible] ...directly between the varying magnetic field and the transmitting medium complete the apparatus.

791,656. Telephone-current Reinforcer or Relay. Herbert E. Shreeve, Newton, Mass., assignor to the American Telephone and Telegraph Company, Boston, Mass. Application filed February 28, 1905.

In a system for the [illegible] ...of telephone currents are a main telephone circuit and a relay apparatus [illegible] ...comprising a receiving magnet and transmitting electrodes actuated thereby to receive telephonic impulses from one circuit or part circuit, and to [illegible] ...retransmit the impulses in another circuit. [illegible]

791,657. Telephone Transmitter. Emil R. Snyder, New York, N. Y., assignor of one-half to Rudolf Lenk, Brooklyn, N. Y. Application filed March 21, 1904.

A telephone transmitter comprises a casing, diaphragms set therein, a support located between the diaphragms, disks or plates, carried by the support yet insulated therefrom, loose contact bodies interposed between the disks and the diaphragms, and means for conducting an electric current to the disks and diaphragms respectively.

791,673. Electric Meter. Frank P. Cox, Lynn, Mass., assignor to the General Electric Company, Schenectady, N. Y. Application filed March 2, 1903.

In the meter are two main-current armature paths in which the currents conspire to produce rotation, and means for adjusting the proportion of current flowing though the paths. A feature of the meter is a bath of mercury in which the movable element is submerged.

791,691. Electric Heater. William S. Hadaway, Jr., East Orange, N. J. Application filed August 4, 1903.

An electric heater comprising a resistance plate is composed of wrought sheet metal cut into a continuous strip and having its original grain undisturbed.

791,730. Electrical Mouth Bath. Johan J. Stanger, Ulm, Germany. Application filed June 1, 1903.

A perforated vessel adapted to receive a liquid forms one electrode of an electric circuit. A porous covering is placed about the vessel, and a second electrode is arranged to be applied to any portion of the body. The vessel is then inserted in the mouth.

791,750. Trolley-retrieving Device. Henry B. Clarke, Oak Park, Ill. Application filed September 3, 1904.

Besides the usual spring device on the trolley base there is a dash-pot arrangement operatively connected with the trolley pole.

791,780. Electric Time Switch. Jacob Helmstadter, Jr., McKeesport, Pa. Original application filed December 11, 1903. Divided and the application filed July 26, 1904.

Combined with an electric switch are an alarm-winding shaft in an alarm clock, an arm on the winding-shaft, a spring piece extending around and under the switch in its lowered position, and a single lever formed of wire actuating the switch.

791,797. Electric Self-winding Clock. Apollinarius von Kaspis, Weehawken, N. J. Application filed June 23, 1904.

A self-winding clock comprises a spring shaft and a spring-driven clockwork, an electric motor, an electric circuit for the motor and a motor switch in the circuit, operated from the intermediate driving gear of the clockwork.

791,816. Current-collecting Device for Electric Cars. Leon W. Pullen, Philadelphia, Pa., assignor to the Wireless Railway Company. Application filed July 18, 1904.

A current-collecting device extending from axle to axle close to the roadbed is sustained by insulated supports from the axles, with freedom of lateral movement. Connecting means are placed between the collecting device and vehicle body whereby the body is free for vertical movement, but not lateral movement, relatively to the collecting device.

791,835. Trolley. Louis M. Steele, Middletown, Ohio. Application filed November 12, 1904.

Details are described.

791,836. Electric Train-control System. August Sundh, Yonkers, and Axel Magnuson, New York, N. Y. Application filed February 16, 1905.

A source of alternating-current supply drives alternating-current motors on the cars. Circuits adapted to connect the motors to the source of supply and controlling circuits therefor on each car, and inductive means for operatively associating the controlling circuits between the cars, are the essential features.

791,856. System of Electrical Distribution. Vincent G. Apple, Dayton, Ohio. Application filed February 18, 1904.

In a system of electrical distribution is a working circuit including the winding of a transformer and working devices. A condenser, a path for the discharge of the condenser including another winding of the transformer and a circuit closer, a path for charging the condenser having a gap therein through which the condenser cannot discharge and means for creating electrical impulses in the charging path of the condenser capable of jumping the gap are the patentable features.

791,882. Thermostat. John H. Cornelison, St. Louis, Mo. Application filed February 15, 1905.

A spring member susceptible to temperature variations makes and breaks the electric circuit.

791,885. Controller for Electric Motors. Arthur C. Eastwood, Cleveland, Ohio. Application filed September 14, 1904.

A controller having a spindle and segmental contacts carried thereby, includes contacts arranged to form a reversing switch. A contact arm is operated from the spindle. A starting rheostat is connected to fixed contacts and a series of contact buttons are placed to coact with the contact arm.

791,886. Controller for Electric Motors. Arthur C. Eastwood, Cleveland, Ohio. Application filed September 16, 1904.

A controlling system for electric motors includes a bank of resistance, switches connected to govern the resistance including a switch for cutting out the entire bank of resistance, a magnet movable adjacent to the switches, contact strips and brushes carried by the magnet in engagement with the contact strips.

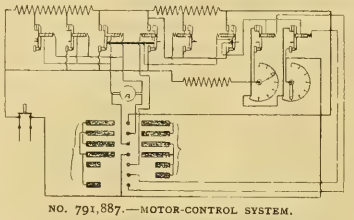
791,887. Motor-controlling System. Arthur C. Eastwood, Cleveland, Ohio. Application filed October 24, 1904.

Means are provided for reversing the motor, also means for automatically causing a step-by-step variation of the current flow occurring between the time when current is applied after operation of the reversing means and the time the armature reverses its direction of rotation. (See cut.)

791,892. Telephone Transmitter. Milton J. Fletcher, San Antonio, Texas. Application filed March 3, 1904.

A telephone transmitter, having a cup carrying a fixed and a movable electrode, the two electrodes being held in spaced relation, has also an integral stem, a cap on the stem, a spring contacting with the cap, a granular resistance substance interposed between the two electrodes and a diaphragm having an adjustable device cooperating with the movable electrode.

791,929. Power Installation. William Morrison, Chicago, Ill. Application filed October 27, 1904.



NO. 791,887.—MOTOR-CONTROL SYSTEM.

In a power installation run by a gas engine is a dynamo having both its field and armature rotable, one of the elements being mechanically connected with the engine, and the other being arranged for mechanical connection with the load. Means are provided for energizing the field and armature of the dynamo, for preventing the rotation of the dynamo element connected with the engine, and for preventing the rotation of the other dynamo element.

791,938. System of Electrical Distribution. Granville E. Palmer, Boston, Mass., assignor of one-half to Charles B. Price and Frank S. Price, Boston, Mass. Application filed July 5, 1904.

A primary alternating-current circuit, a secondary circuit, a constant-current transformer, a switch in the primary circuit, an underload-release mechanism in the secondary circuit, an overload-release mechanism in the primary circuit and means by which each of the mechanisms causes the opening of the switch are the essential parts of the system.

791,951. Crane. George W. Shem, Alliance, Ohio. Application filed March 17, 1905.

A crane having a bridge with main hoisting trolley mounted upon the main girders of the bridge, is provided with a supplementary trolley mounted upon supplementary girders independent of the main girders, the supplementary girders being located between the main girders.

791,954. Time-controlled Electric Switch. Joseph G. Swallow, New York, N. Y. Application filed July 23, 1904.

A time-controlled gravity-drop mechanism comprises an operating-arm, a guide-channel, an unattached weight and a weight-releasing mechanism adapted to release the weight to cause it to fall in the guide-channel. The arm is adapted to occupy a position within the channel in the path of the weight before its fall, to be withdrawn from the weight afterward.

791,958. Automatic Blast-temperature Regulating Valve. Samuel W. Vaughen, Lorain, Ohio, and John W. Cabot, Johnstown, Pa. Application filed January 10, 1903.

The valve for the hot blast pipe is operated by an electric motor and a pyrometer controls the circuit of the motor, its action being determined by the temperature in the furnace.

791,961. Burglar-alarm System. Joseph Weatherby, Jr., New Cumberland, Pa., assignor to the Weatherby Electric and Manufacturing Company, New Cumberland, Pa. Application filed March 31, 1904.

In an electric burglar-alarm system is a balanced electric circuit with means to vary the resistance in localized portions without unbalancing the circuit. Means independent of the resistance-varying means vary the potential of the electric current in the circuit.

791,972. Automatic Electric Signaling System for Railways. David C. Wolfe, Lyons, Kan. Application filed January 5, 1905.

Signaling apparatus carried by a train and a signaling apparatus at a station co-operate with a pair of conductor-wires arranged along the road-bed and divided into blocks. Means carried by the train electrically connect one of the conductors to the signaling apparatus at the station, the circuit passing through the signal mechanism on the train. Means at the station complete an electric circuit through the alarm mechanism on an approaching train.

791,975. Skeleton Tower. Robert L. Allen, Syracuse, N. Y., assignor to the Archbold-Brady Company, Syracuse, N. Y. Application filed December 29, 1904.

A steel tower for carrying high-tension conductors is described.

791,977. Snap Switch. Walter A. Church, Binghamton, N. Y., assignor to Edward P. Hatch and Jonathan Camp, Hartford, Conn. Application filed June 17, 1903.

On a base of insulating material are a movable contact and a stationary contact, the stationary contact being provided with a recess having one wall of the recess forming a positive stop to prevent rotary movement of the movable contact.

791,982. System of Electrical Traction for Railways. Maurice Leblanc, Paris, France. Application filed August 29, 1901.

A series of current-supplying points co-operate with a fly-wheel motor-generator, receiving at intervals a motive current from the supplying points, and supplying working current to the vehicle.

791,983. Electric Motor-generator. Maurice Leblanc, Paris, France, assignor to the Westinghouse Electric and Manufacturing Company, Pittsburg, Pa. Original application filed August 29, 1901. Divided and this application filed December 9, 1904.

A fly-wheel dynamo for rotating at high speed comprises a frame for supporting its stator, a universal joint for supporting its rotor, the surface of the rotor and stator adjacent to the air-gap being shaped as spheres having the universal joint for a center, and a standard on the rotor having a loose bearing in the frame.

791,984. Train-controlling Mechanism. Henry V. Miller, Chicago, Ill., assignor to the Miller Signal Company, Chicago, Ill. Application filed January 14, 1905.

A local partial electric circuit is associated with a transient mechanism comprising a transient partial electric circuit containing a magnet through which the local partial circuit may be completed. An armature controlled from the magnet. An electric device controls the valve and is controlled by the armature.

## EXPIRING PATENTS.

Following is a list of patents (issued by the United States Patent Office) that expired on June 12, 1905:

384,271. Electric Pendulum Clock. A. L. Parcelle, New York, N. Y.

384,289. Automatic Switch for Secondary Batteries. J. S. Sellon, Hatton Gardens, County of Middlesex, England.

384,320. Printing Telegraph. E. J. Mallett, Bay Side, N. Y.

384,321. Polarized Electromagnet. E. J. Mallett, Bay Side, N. Y.

384,322. Printing Telegraph. E. J. Mallett, Bay Side, N. Y.

384,323. Automatic Pole Changer. E. J. Mallett, New York, N. Y.

384,324, 384,325. Automatic Telegraphy. E. J. Mallett, New York, N. Y.

384,326. Automatic Pole Changer. E. J. Mallett, Bay Side, N. Y.

384,350. Combined Telegraph Key and Sounder. J. Doggett, Plain City, Ohio.

384,404. Machine for Covering or Insulating Wire. J. D. Thomas, South Framingham, Mass.

384,430. Electrical Annunciator. H. S. Downerd, Zanesville, Ohio.

384,440. Electric Circuit Controller. O. F. Grein, Newark, N. J.

384,447. Regulating Commutator for Secondary Batteries. E. Julien, Brussels, Belgium.

384,455. Printing Telegraph Receiver. H. Mahnken, New York, N. Y.

384,472. Electric Winding Attachment for Clocks. A. J. Reams, Augusta, Kan.

384,476. Police Electric Signal System. C. E. Scribner, Chicago, Ill.

384,477. Multiple Switchboard Circuit. C. E. Scribner, Chicago, Ill.

384,561. Electric Comb. C. Busch, Chicago, Ill.

384,562. Electric Railway. G. H. Condict, Philadelphia, Pa.

384,570. Electric Circuit-Closing Device. M. W. Groversteen and P. G. John, New York, N. Y.

384,576. Electric Railway. R. M. Hunter, Philadelphia, Pa.

384,580. Apparatus for Electric Traction. E. Julien, Brussels, Belgium.

384,581. Electric Railway Car. E. Julien, Brussels, Belgium.

384,594. System of Electric Locomotion. H. A. Seymour, Washington, D. C.

## SPECIAL MENTION.

Pass & Seymour of Solvay, N. Y., make a specialty of fuseless cleat rosettes, National Code fuseless attachment plugs and sign receptacles. In regard to the quality of these products, they receive many flattering comments from their customers. The manufacturers assert that "prices in themselves are not conclusive. You must weigh the goods with the price."

The traveling public, especially business men making hurried trips between Chicago and New York, will appreciate the reduction in time of the Twentieth Century Limited, via the New York Central Lines, taking effect Sunday, June 18th. To give longer time in Chicago and reach New York no later next morning, it has been arranged to schedule this train from Chicago at 1:30 p. m., an hour later than at present, reaching New York at 9:30 a. m., reducing the running time of the train to 19 hours. Westbound, the Twentieth Century Limited will continue to leave New York at 2:45 p. m. daily, reaching Chicago at 9:45 the next morning.

Howard V. Weaver on June 10th resigned as advertising agent of the Chicago and Eastern Illinois railroad and has become associated with the Corbitt Railway Printing Company, 383-389 La Salle Street, Chicago. Mr. Weaver has had an extended experience in railway and advertising work and his wide acquaintance and popularity will prove a valuable asset in his new connection.

Slow-speed motor drive for all sorts of machines is very satisfactorily accomplished by the use of Northern back-geared motors. This is a compact, self-contained device which accomplishes slow speed without the necessity of employing motors designed for slow armature speed. This secures a motor of low cost for operating slow-speed machines. Bulletin No. 44 issued by the Northern Electrical Manufacturing Company of Madison, Wis., illustrates representative applications of back-geared motors in industrial-plant service.

# WESTERN ELECTRICIAN

EVERY SATURDAY

Vol. XXXVI. CHICAGO, JUNE 24, 1905.

## Engineering Equipment of the Minneapolis Chamber of Commerce.

By Charles H. Coar.

During recent years Minneapolis has come rapidly to the front as a grain center and trading market, and, because of this growth, the members of the Board of Trade were compelled to seek more spacious quarters in which they could conduct their business. After having some difficulty in securing a good location for a new building, plans were prepared during the year 1901 for a fine 10-story building. The site chosen is adjacent to the old Chamber of Commerce Building and has a frontage of 157 feet on Fourth Avenue South, by 132 feet on Fourth Street. The building, which is 10 stories in height above the street level, is built to these dimensions, with the exception of the basement, which extends out and under the sidewalks to the curb lines of the streets.

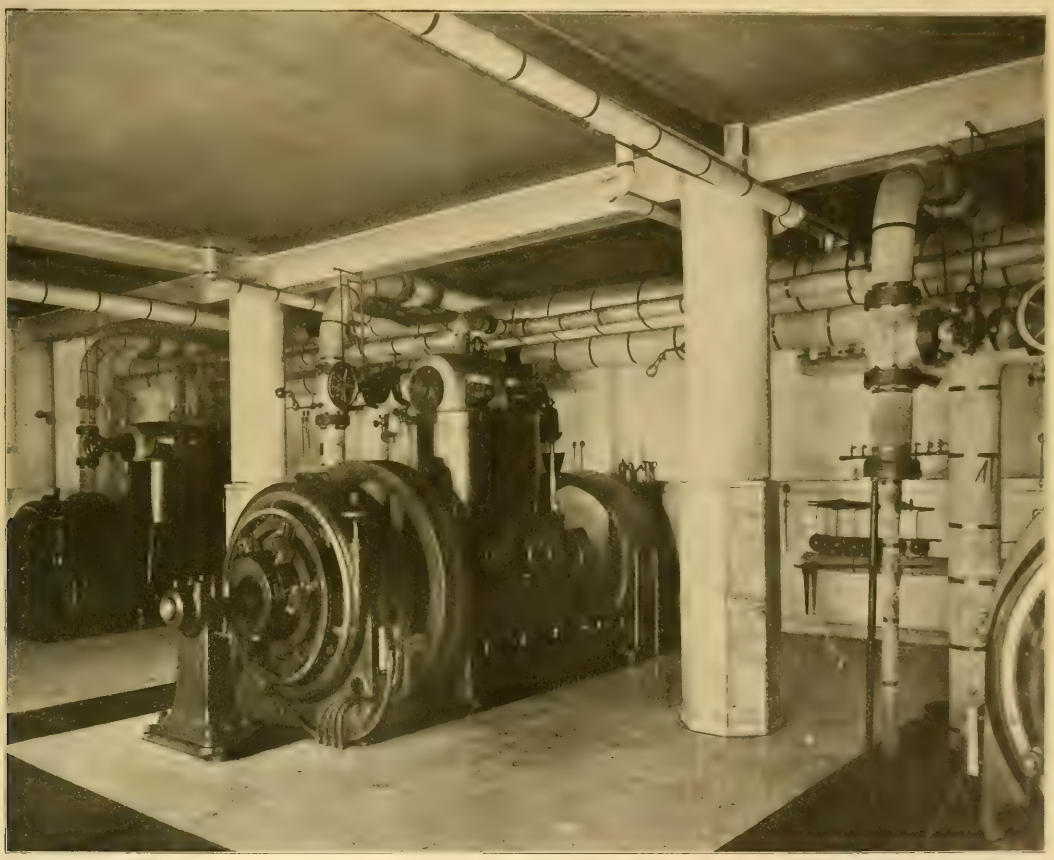


FIG. 1. VIEW IN ENGINE AND GENERATOR ROOM OF MINNEAPOLIS CHAMBER OF COMMERCE.

The steam and electric equipment of the building is complete, having been carefully designed and laid out with reference to permanence, maintenance and cost. In the boiler room, which is in the basement, there are located five 150-horsepower Scotch marine boilers. Each boiler is equipped with a Clarke automatic water control located inside the boiler, which regulates the height of the water, and in addition there is an ordinary glass water gauge outside the boiler. Each boiler is also provided with a safety valve connected to the exhaust pipe beyond the reducing valve, in order that the steam may easily escape in case the steam pressure [illegible]

The boilers are all equipped with Crosby steam gauges reading from 0 to 200 pounds. The steam header for the five boilers is located about three feet in height over the rear portions of the boilers, and long-bend connections are provided, with extra heavy gate valves to connect the different boilers to this header.

The smokestack is constructed of iron and brick within the walls of the building and is five feet in diameter. Directly connected to the stack is a smoke intake, five by five feet, of steel construction, which passes in front of all the boilers, where two-by-five-foot uptakes from each boiler feed into it. A forced draft is used.

Coal is used as fuel, and a bunker having a capacity of 300 tons is provided under the alley, where openings are placed through which the bunker is filled. A track system from this bunker extends in front of all the boilers, in addition to passing over a scale platform, which is used in weighing the coal as it is consumed. A similar scale of 10-ton capacity is also placed at the rear of the building, to weigh in coal when it is purchased by the car on the railroad.

There is also located in the boiler room a water heater and purifier, an exhaust muffler and three Marsh steam pumps 8-12 by 7½ by 12 inches—all of which obtain their water supply from the city water mains. Two of these pumps force water into the [illegible]

The main 10-inch steam header from the boiler [illegible] there are located three engine taps taken from through-gate valves. Placed in this steam header, [illegible] arator, which is in turn connected to a Crane steam trap that discharges into the feed-water heater.

The engine equipment consists of three West- [illegible]

The engine room is 50 feet in length and 40 feet in width, and is provided with a 15-ton traveling crane, which is used in handling the engines and generators. The switchboard is located in the engine room, and is of the Westinghouse type, consisting of [illegible]

The engines are operated at a speed of 250 revolutions a minute. Two of these engines are 125 horsepower, and one is 80 horsepower, all being directly connected to Westinghouse compound engine-type generators. The splash system of oiling is used in the crank cases of these engines, the outboard bearings being oiled by rings, as is customary in Westinghouse engines.

A partial view of the engine room is shown in Fig. 1. The exhaust from each engine opens into a 12-inch main exhaust, which is provided with a Detroit grease extractor, before the exhaust steam enters the muffler tank. From the muffler tank the exhaust-steam connections are so arranged that the exhaust steam escapes through coils used in heating the building, or into the water heater direct, as the occasion requires. The water heater, as used, is divided into two sections, all exhaust steam passing in one end through one-inch copper tubes, which are surrounded by the water

to be heated, while the other section has a bed of coke placed in it, through which the feed water is forced before it reaches the boilers. This coke removes all foreign substances, such as boiler scale or sediment, from the water. The coke end of the heater is provided with a live-steam tap, connected directly to the boiler header, for the purpose of forcing steam through the coke at intervals, in order that any collected hard scale, etc., may be dislodged into a catch basin provided for that purpose. The exhaust steam from the heater escapes into the outer air at the roof.

Space is provided in the engine room for the installation of a fourth unit, if such be found necessary, and in order to facilitate this installation a panel is reserved in the switchboard.

The generators all deliver current at 230 volts pressure, and the current from the generators is conducted to the respective switchboard panels by means of heavily insulated cable in conduits placed under the tile floor of the engine room.

The switchboard is set off at one side of the units, about 10 feet from the wall, thus insuring ample space in which to work at the rear connections. A front view of the switchboard is shown in Fig. 3. The front is composed of six panels of black marble 6½ feet high. These panels are supported in a white Italian marble frame held between two white marble columns, as shown in

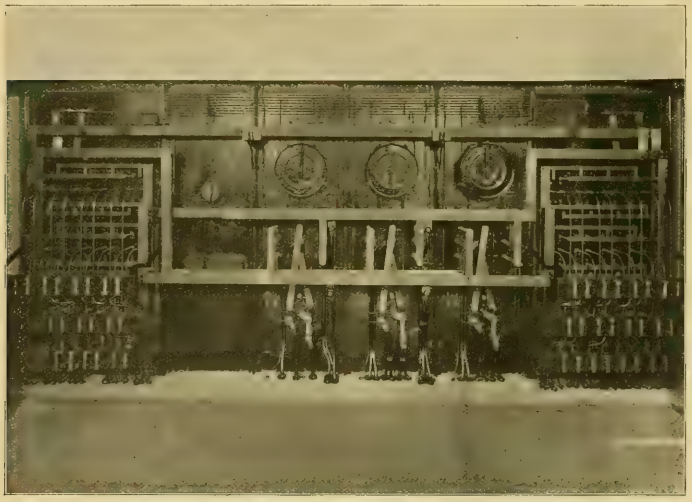

FIG. 2. REAR OF SWITCHBOARD IN MINNEAPOLIS CHAMBER OF COMMERCE.

the illustration. Extending back from the right end of the switchboard to the wall are five panels of black marble, which are used as meter panels, while on the left end four panels are installed for storage-battery instruments. A wall having a door is built on from these panels to the building wall proper. This encloses the rear connections of the panels, thus insuring freedom from outside interference.

Of the six front panels, the two end sections are the power and lighting panels, the four remaining ones being used for generator panels, with the exception of one, which is held in reserve, as already explained.

Each of the three generator panels is equipped with a Keystone amperemeter, a Ward Leonard rheostat, ground-detector lights, a voltmeter switch, a double-pole double-throw knife switch, by which the generator may be connected to either the power or lighting buses, a single-pole double-throw knife equalizing switch, used when the generators are thrown in parallel, and an I.T.E. overload double-pole circuit breaker. The apparatus on one of these panels is suited to 75-kilowatt generators, while the other panel is equipped to suit a 50-kilowatt machine. The first or power panel is equipped with a Bristol recording ammeter, a Keystone voltmeter and 12 double-throw double-pole knife switches. Eight of these control floor lights, while three are used to control the current to the ventilating motors. The remaining switch is used in case the fuses on the regular feed break down, or in time of excessive loads, to assist the regular feeders. The sixth or lighting panel proper is a duplicate of the power panel, with the exception of the switch control. Eight of the switches in this panel control building lighting circuits, one switch controls the current supply to the electric elevators in the old Chamber of Commerce Building, and two switches control the current to two 50-horsepower Otis controlled motors, which drive high-pressure triplex pumps in the elevator system. The remaining switch in this panel controls the current to a 10-horsepower motor, arranged with Cutler-Hammer tank control. This motor drives a low-pressure triplex pump, which handles the water discharged by the pilot valves of the elevator system.

As will be noted in the view of the switchboard, the steam instruments are mounted above the electrical apparatus, such not being considered the best practice, by some, but in this instance necessary, so special arrangements were made to catch any moisture or drippings from the steam instruments. A copper catch basin, provided with drain pipes at each end, extends the entire length of the board beneath the steam instruments.

A view of the rear of the switchboard is shown in Fig. 2. The generator, bus and switch connections are such that the lighting and power may be operated separately or as one system, and any of the generators may be connected to any set of bus bars, or to both at the same time. All the generator switches are double-throw, so that any of the generators may be thrown into service on certain bus bars to meet any desirable division of the load. Bus connections are so arranged that in case it becomes desirable to install a storage battery in the future a differential battery booster may be connected in between the two sets of bus bars, to prevent flickering in the building lights in case the power load fluctuates. The generator and bus connections are simple but effective.

The current consumption is very carefully computed, as wattmeters are provided for measuring the total current generated by each generator, the current consumed by the elevator-pump motors and the current consumed by the ventilating motors. In addition, the current used in lighting the corridors is measured separately. Each tenant receives his current supply through individual meters. A meter is also provided to measure the current used from the city central-station mains in case of a total shutdown, as provisions are made to utilize this current if it becomes necessary. It can be readily seen that, with the readings from these meters, in addition to the curves taken from the recording amperemeters and steam meters, that it is possible to figure very closely as to the operating cost. Four panels are also provided for use in connection with storage-battery instruments, in case these be installed. Fig. 4 is an ammeter record showing the variations in load during the day.

All the service wires of the building, including the telephone and telegraph wires, are installed in enameled electrogalvanized iron conduits, placed in the walls or under the floors. This offers the best fire protection, in addition to being free from mechanical injury. The wires in the different conduits were not installed until the construction work of the building was nearly completed, so it is still possible to replace any of the circuits or wires with good wires in case they become faulty.

About 40 cut-out cabinets for the control and protection of the tenants' lighting circuits are installed at the most accessible points in the different floor corridors. These cabinets are very attractive and consist of a black-marble switchboard upon which are mounted the different copper buses, switches, etc. This is then set in a black slate frame and iron box, the whole being trimmed with white marble. The doors are constructed of heavy plate glass set in an iron frame of pretty design. The conduit piping is provided with outlet boxes at every point where the wires emerge for fixture connection, and although an abundance of floor and base-board receptacles were installed to which connections could be made, it was deemed wise to install a flexible steel-covered cable in a special molding placed above the walls of each room. By means of this cable it is possible to install a light at any position on the walls with very little labor and without marring the room to any extent. The tenants' meters on each floor are mounted on a black marbleized-slate board located in a room provided for that purpose. The meter connections are so arranged that the room circuits may be materially changed without affecting the metering.

About 150,000 feet of rubber-covered wire was used in the old building in wiring the lighting and power circuits, and approximately 500 base and floor receptacles are used for distribution, in addition to the regular fixtures. Upward of 5,000 incandescent lights are used in the lighting system, but no arc lights are employed.

Telegraph and telephone cables are placed in conduits up to their respective distribution centers. The telegraph circuits terminate mostly in the trading room proper, but the telephone cable conductors are distributed throughout the different floors by means of terminal strips located on the different floors. The telephone cables of both the Bell and Independent companies are brought into the building from street manholes to large distribution boxes located on the first floor. From this point the cables pass up to the various floors through the meter rooms.

In the meter rooms the cable conductors terminate on suitable cross-connecting strips, provisions having been made for proper distribution, where connection can be made with the room wires, which are placed in conduits and special molding. There are upward of 20 private telephone-exchange systems in the building. The Bell company has a toll exchange located on the trading-room floor which handles the long-distance calls to and from the booths located there. Both telephone companies have installed an ample number of booths for the convenience of their respective patrons. Practical systems of signaling, which involve the use of incandescent lights, are used, in conjunction with the telephone systems and also on the quotation board.

The old Chamber of Commerce Building, which was all rewired, receives its power and heat from the new plant, but otherwise is separate from the new building. The motor equipment of the plant is very complete and consists of the following installations: For heating and ventilating the building proper there are used two motors arranged for 220-volt service. One of these motors is of 40 horsepower and the other is 30 horsepower.

A 20-horsepower motor is used for heating and ventilating the trading room, this being controlled entirely separate from the main heating system. There is also located on the roof of the trading room a 10-horsepower motor and an exhaust fan which has outlets placed about the base-boards of the room to assist the air circulation of this room when it is crowded. A 10-horsepower motor is used to run a circulating pump in the air purifier, and one of five horsepower is used to furnish cool air in the engine room. Another five-horsepower motor is used to run fans for toilet-room ventilation. All the motor equipment mentioned is supplied with Cutler-Hammer Universal motor controllers according to the designing engineers' specifications.

There are awo 50-horsepower motors which drive two 35 by 16 by 12-inch triplex pumps for the elevator system. These motors are arranged with Otis elevator control and are used as an auxiliary to the steam-driven pumps or during warm weather or breakdowns. A 10-horsepower motor is utilized to run a small automatic triplex pump, which pumps

FIG. 3. SWITCHBOARD IN MINNEAPOLIS CHAMBER OF COMMERCE.

a slate board 6ft by 8ft feet. These magnets are actuated by an accumulator weight which carries a sliding bar, operating cam switches, in this manner closing circuits through the solenoids in the main controlling board. By means of the automatic control there is a reserve pressure maintained at all times in the high-pressure system which operates the cars. On the piston of the high-pressure elevator cylinder is mounted a 35-ton accumulator weight, arranged in such manner in regard to the pumps that it has to be maintained at a certain height, which insures a sufficient reserve pressure in the system to propel one car a complete trip, or it lowers sufficiently to engage contacts already mentioned, or other mechanism, which operates the valves on the steam pumps. The electric operation is such that when the accumulator weight lowers sufficiently to engage the contacts it closes the solenoid circuits on this motor control, first starting one motor and pump and gradually bringing it up to its capacity by means of the accelerating magnets contained in the control. If sufficient pressure is not then maintained, the remaining motor and pump is also started and brought up to its maximum capacity in a like manner. When both pumps are in operation the pressure in the system is rapidly restored, and as the accumulator weight rises the pump motors are automatically cut out of circuit in their respective order.

It will be seen that the circuits are so arranged

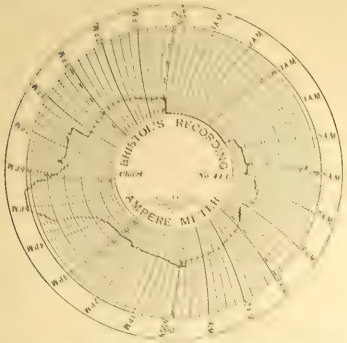

FIG. 4. RECORD OF LOAD ON PLANT OF MINNEAPOLIS CHAMBER OF COMMERCE NOVEMBER 15, 1904.

that by throwing a small triple-pole double-throw knife switch, the pump motors can change in their starting position, thus insuring a uniform amount of wear on the apparatus. The steam-operated pumps are controlled in a similar manner by mechanism which operates on the steam feed valves to the pumps.

An indirect system of heating is employed for

mostat arrangement of the rooms is such that the

mostats of the rooms that the coils heat.

These latter coils can raise the temperature to

cient to heat the building during the coldest day. There are nearly 1,100 automatic valves in the heating system and about 300,000 cubic feet of air is passed through the building and out to the roof each minute. As mentioned before, this air is all moved by electric-driven fans.

The conduit and switchboard work in the plant was done by the W. J. [illegible] Company of Minneapolis, under the supervision of the designing engineer, Mr. Charles [illegible] of St. Paul, Minn.

The plant is under the excellent supervision of Mr. William Robertson, who is chief engineer and superintendent of the building. Mr. Robertson is assisted by Mr. G. R. Scott, who is chief electrician. The writer wishes to make acknowledgment to both these gentlemen for the many courtesies extended him during the preparation of this article.

## A History of Franchises in Benton Harbor and St. Joseph, Mich.

Benton Harbor and St. Joseph, Mich., on the east shore of Lake Michigan, across from Chicago, are the center of important lighting and traction interests. The company operating in these two cities is the Benton Harbor and St. Joseph Electric Railway and Light Company, with headquarters in St. Joseph. The president of the company is W. Worth Bean, well known among central-station men, while his son, W. Worth Bean, Jr., is the secretary and manager. The successive steps which have been taken during the last 16 years leading up to the present-day situation are of interest.

The elder Mr. Bean, on Feb. 28, 1888, bought a third interest in the Benton Harbor and St. Joseph Street Railway Company, and on February 7th of the same year he had organized the Benton Harbor and St. Joseph Light Company. In September, 1891, Mr. Bean, after obtaining a controlling interest in the street-railwaay company, brought about the passage of a bill by the state legislature allowing horse railways and electric lighting companies to consolidate. On March 30, 1889, he had obtained franchises in the two cities for furnishing light and power for 30 years, and, October 19, 1891, ordinances to operate cars by electricity for 30 years.

Following these moves, the next step in the development was the securing of an ordinance in South St. Joseph for electric-car operation, also for 30 years. This was done on June 20, 1896. On September 18, 1901, all street-car ordinances were extended to make a uniform period of 30 years.

In October, 1900, all electric-railway and light company ordinances were consolidated and all the stock was then in the hands of Mr. Bean. On May 24, 1905, the electric light [illegible] March 30, 1889, was [illegible] 1905, with permission for high and low-tension operation. All street-car ordinances were also extended for 30 years on [illegible]. At the same time the franchise of the Indiana Railway Company, granted in June, 1901, was purchased and extended for 30 years. One hundred leading citizens were present at the council meeting and urged all extensions, with the privilege of carrying freight during the whole [illegible] the day. This [illegible]

Typical Independent Telephone Exchange for Small City

FIG. 1. INDEPENDENT TELEPHONE EXCHANGE IN PORTAGE, WIS.

[illegible] are at this time confronted with a proposition of how to rebuild, if possible, without increasing the capitalization of their organization and to make the changes out of the proceeds of the business.

An Independent exchange which clearly shows what is now considered by conservative and unbiased engineers and practical telephone men to be the best method of rebuilding, and the most economical and safe plan of re-equipping, is the remodeled plant of the Portage Telephone Company at Portage, Wis. A brief account of the rapid growth of this exchange and its present system will be of considerable interest, especially at this time when many of the exchange companies are figuring on some change in their own systems.

[illegible] years ago by a number of the leading business men of that city, the most prominent of whom were [illegible]. The [illegible] ers, and was built with an ultimate capacity of 1000 lines, with instruments of the regular [illegible] ator-call type, and the line construction with a ground-return circuit.

[illegible] years when it had reached its ultimate [illegible] positions.

[illegible] wire leads were [illegible]

In making the change of apparatus it was decided to re-equip the central office with a switchboard that could be used first in connection with the generator-call instruments then installed, and later changed to full central-energy system, when the old generator-call instruments could be replaced with central-energy telephones.

The equipment adopted was the "growing" exchange system put on the market by the International Telephone Manufacturing Company of Chicago. This system is designed so that a plant can be rebuilt at intervals by first installing the switchboard to be used in connection with individual generator-call local-battery telephones, and later at any time changed to complete central-energy without discarding any of the apparatus installed. It is also designed so that the switchboard can be first installed as a straight trunking equipment, and having a capacity in the frames so that when the exchange is increased to 400 or 500 subscribers or more the necessary multiple springjacks, with wiring, etc., may be added to the sections, and the board changed from a transfer system to a strictly multiple equipment without discarding any of the apparatus except the trunk-line jacks. Fig. 2 shows a view of the Portage exchange room and switchboard.

The switchboard is built in sections arranged for one operator's position each. The sections are built of well-seasoned quartersawed-oak woodwork, with golden-oak finish, highly polished. The key shelves are hinged so that they may be raised, making the wiring and apparatus readily accessible. They are built of five layers of the wood of which the board is constructed, glued together—the grain of the two outside and central layers running lengthwise and the grain of the other two layers running cross-wise. The plug shelves are covered with the best belt leather, one-eighth of an inch in thickness. The back of each section is provided with a paneled double-hinged door. The front of the board is provided with a substantial brass foot rail.

The first position of the board is equipped with 40 toll-line and country party-line equipments, consisting of high-wound bridging non-inductive tubular mechanical self-restoring drops and jacks. The combined drops and jacks are mounted individually in strips of five. They are clamped to a substantial steel mounting strip by the ferrule of the jack, from the front of the board. The jacks and drops are thoroughly insulated from the mounting strip by one thirty-second-inch sheet mica with hard-rubber bushings insulating the jack ferrules. The drop and jack may be removed without dismounting the drop shutters. The shutters are mechanically restored by a small trigger mounted in the path of the plug, which operates and throws up the shutter when the plug is inserted into the jack. The restoring trigger is supported on a heavy german-silver compensating spring, to allow of its permanently retaining its adjustment, making it impossible for the shutter to fail in restoring when the plug is inserted. The jack springs are constructed of the highest grade german silver No. 18 sheet.

FIG. 2. PORTAGE EXCHANGE ROOM AND SWITCHBOARD.

The first position is also equipped with the regular local-battery switchboard transmitter, with transmitter arm and other auxiliary apparatus, together with an operator's receiver, receiver cord, plug and cut-in jack, including a hand generator, power generator key, night-bell switch, and special switches for cutting together the different operators' circuits. This position is also equipped with the necessary connecting appliances for making connection between the central-energy exchange and toll lines, and vice versa, and also between the different toll lines and country party lines.

The second and third positions are each equipped with 200 lamp-line equipments, and the fourth position with 60 lamp-line equipments, and fully wired for 200 lines.

Each position is also equipped with 16-pair cords, plugs, weights, ringing and listening keys, with double-lamp supervisory clearing-out signals, together with complete operator's telephone and other auxiliary apparatus.

In Fig. 2, at the top in the face of the board, are shown the white line pilot lamps and the red supervisory clearing-out signal pilot lamps. The line signals are mounted in connection with their associated jacks in strips of 10. The answering jacks and lamp jacks are mounted on the opposite sides of a substantial brass base having the jack springs firmly clamped between mica insulations by heavy binding screws passing through them and terminating in metal nuts. The lamps are provided with a brass tube, clamping the lamp and also supporting the opal, and are so designed that they are placed into the lamp jack from the front of the board. The lamp-jack springs are so constructed that it is impossible to insert the lamp excepting in its proper position. The lamps can be removed and replaced without the use of special tools or devices.

FIG. 3. RELAY RACK IN PORTAGE EXCHANGE.

Strips of combined lamps and answering jacks are mounted on a strongly constructed steel frame, firmly fastened in the front of the switchboard cabinet. The strips are fastened into the frame by heavy binding screws passing through the strips from the front of the board. The space remaining for the additional capacity of line equipments and also the capacity for additional trunking equipments, or the multiple jacks necessary when the system is changed to a multiple equipment, are filled in with blank steel strips of the same dimension as the lamp and jack-mounting strips. This enables increasing the exchange with 10-line equipments at a time, by removing one of the blank strips and inserting a strip of 10 combined lamp and answering jacks, and making the necessary wire connections already provided. The mounting-strip binding screws are covered with a neat stile strip fastened from the front of the board.

Supervisory clearing-out lamps are provided, with a shell attachment similar to that of the line lamps, and, to protect the opals from impact of the plugs, they are provided with an arched wire protecting guard. The supervisory lamps can be readily removed from the top of the keyboard.

The present equipment of the board is provided with a flashlight transfer system between the positions. The plugs are the regular multiple switchboard plugs. The jack mounting strips, being of steel construction, enables building them so that an extremely short plug may be used, which allows making the plug small and compact and at the same time give it the proper strength. The plug is provided with a loose sleeve, avoiding the use of binding screws passing through it. This construction makes the use of a thin sleeve possible, and it being so mounted that it turns on its shank, prevents kinking the cord when twisting the plug while inserting.

The line signals and supervisory signals are controlled by individually encased tubular relays, supported on an iron rack, as shown in Fig. 3. The relays are constructed with a coil placed in a heavy soft-iron tube, which completely closes the magnetic field when the armature is drawn up. The coil terminals pass through the rear of the tube and are insulated with hard-rubber bushings, making the tube practically air-tight when the armature is closed. The core of the coil passes through the rear of the tube, from which it is thoroughly insulated with hard-rubber bushings and mica washers, and forms a support for the relay springs, which are firmly clamped between sheet-mica insulations by heavy binding nuts. The springs are so formed that they pass from this mounting base up over the iron tube to the armature hinge. The armature is hinged on an L-shaped brass hinge, supported on a knife edge. This construction gives a relay in which all the lines of force act on the armature. The armature hinge being more than an inch in length, gives a wide sweep for making and breaking the contacts. The relay is clamped to a round brass base, threaded at its outer edge, upon which is screwed a heavy brass tube shell, to make the relay absolutely dust-proof. The relays, with shell, are individually mounted on a substantial steel mounting strip, to which they are clamped by heavy hexagonal brass nuts. The terminals of the springs, as well as the coil terminals, pass through the mounting strip, from which they are properly insulated by hard-rubber bushings. The relay rack is provided with bus bars, mounted on a marble slab. The proper fuses are provided for individually fusing each strip of relays.

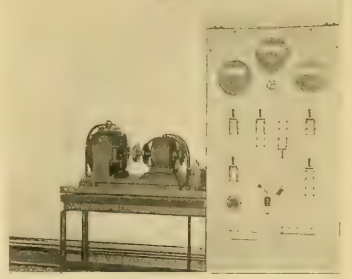

FIG. 4. POWER PLANT IN PORTAGE EXCHANGE.

Fig. 3 also shows an end view of the American Electric Fuse Company's make of carbon lightning arresters and self-soldering heat-coil protectors, supported on an architectural-iron distributing frame and mounting rack.

Fig. 4 shows the power plant. The charging machine consists of a Roth Brothers dynamo, with an output of 12½ amperes, 35 volts, 1,900 revolutions per minute. It is provided with a round-type field rheostat, and is mounted on the same base with a Westinghouse one-horsepower 110-volt single-phase 133-cycle motor. The charging machine is mounted on a heavy hardwood platform, resting on large soft-rubber balls, set in a hardwood frame, supported by an architectural-iron rack table.

The power switchboard is constructed of a large blue Vermont marble slab, with beveled edges, supported on a heavy angle-iron rack. At the top, in the center of the board, is mounted a type F flush-style polished copper-finishel Weston direct-current double-scale 0 to 50 and 0 to 3 voltmeter. Immediately underneath the voltmeter is mounted an ammeter switch, with index plate and hand wheel, of the Crouse-Hinds type. The power board is also provided with two direct-current, 0 to 25, flush-type Weston ammeters. Immediately below the reading instruments are mounted three double-pole single-throw and three double-pole double-throw 125-volt 50-ampere non-fuse copper knife switches, back connected, emery-wheel finished. Directly underneath the knife switches is mounted a Ward Leonard type DK overload and underload circuit breaker, back connected, of polished copper finish—underload three amperes, overload 10 to 20 amperes. At the bottom of the power board are mounted the necessary copper bus bars.

FIG. 5. STORAGE BATTERY IN PORTAGE EXCHANGE.

Fig. 5 shows the storage-battery plant, consisting of two sets of 24 volts each, type E5 Chloride accumulator storage batteries. The batteries are supported on a heavy and strongly constructed wooden rack, supplied with heavy slate shelves. The legs of the several cells are burned together. All battery leads and bus bars are of copper and of sufficient size to insure against cross-talk. The heavy power wires are run through circular loom, to make the work perfectly safe and substantial.

The wires of the lighting, power circuits and storage-battery leads are of the highest grade rubber-covered wire, and of sufficient size to fulfill the requirements of the National Board of Fire Underwriters. The cable used in the switchboard is of No. 22 B. & S. gauge, tinned annealed copper-wire conductors, 98 per cent. pure, and covered with two layers of silk and one of cotton, the outside layer of cotton, colored in accordance with a predetermined color code, facilitating the handling and testing of lines.

With the present careful management of the company, which is under the direct supervision of Mr. F. H. Runkel, secretary and manager, who is well experienced in the telephone line, and with the class of work above described throughout the exchange, it is in position to give the subscribers the most efficient and convenient service obtainable, with the

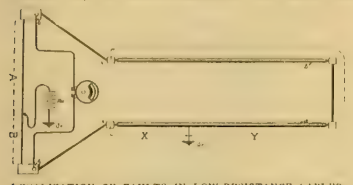
cost for maintenance and operating reduced to a minimum.

It is claimed that with a system [illegible] the central office equipment [illegible] that it will not be necessary to place in commission [illegible] the equipment which is required to accommodate the system, or else to change it to a multiple system and with the new part which is added to each of the equipment as it is put into service no deterioration is made than otherwise.

## Localization of Faults in Low-resistance Cables.

For the purpose of locating faults in cables of comparatively large carrying capacity, and consequently low resistance, the Wheatstone bridge which is used for locating faults is unpracticable for several reasons.

An ordinary bridge or testing set especially adapted for locating faults by means of the Varley-Murray loop method is accurate only when the



LOCALIZATION OF FAULTS IN LOW-RESISTANCE CABLES.

cables under test are of comparatively high resistance, such as telegraph or telephone cables. When used for cables of low resistance, as, for instance, a 250,000 circular mil transmission line, the limitations of such an apparatus are great, and the accuracy with which the fault can be localized is low. Also, the calculations involved, while not complex, necessitate a considerable amount of figuring.

While it is a fact that the greater number of faults in underground cables occur in the manholes of the transmission lines, it is nevertheless desirable to locate the fault with the greatest possible accuracy. The readiness and ease with which such a test can be made is quite important when considered from the standpoint of economy in line maintenance.

The location of the ground or cross on a cable can be very easily accomplished by the following method, which utilizes a slide wire bridge for testing by means of the Murray loop.

The method is described in the "Wrinkles" department of the National Electric Light Association by Mr. K. E. Rice, a diagram of the connections being shown in the accompanying illustration.

A slide wire bridge having a bridge or slide wire of very low resistance (say 0.5 ohm) and which has a scale divided into a given number of parts is connected as follows:

A cable on which the ground is located is connected to one end of the slide wire and a perfect cable of known length is connected to the other end. The distant ends of the cable are connected together by a jumper or clamp of negligible resistance. A milli-voltmeter having its zero in the middle of the scale or a very low-resistance galvanometer is connected across the slide wire as shown at (G) and (G'). The contact-maker on the slide wire is connected to the one terminal of the storage or primary battery (preferably one of very low resistance); the other terminal of the battery is grounded. The electromotive force of the battery need not be over a few volts, except for very high-resistance grounds. The ordinary Murray loop formula is then used:

Let L = total resistance of cables A and B.

X and Y = resistance to faults.

A and B = value of bridge arms when balance is obtained.

Then

$$X = \frac{B}{A + B} L$$

In applying this formula to the slide wire bridge A + B is obviously constant, and it may be considered as having unit value. Also consider that L has unit value; therefore L and A + B are eliminated by cancellation and

$$X = B.$$

The quantity B is then a decimal which, when multiplied by the length in feet of the cable, will give the value of X in feet distance of the ground from G'.

In practice the cable must be connected to the bridge by leads of as low resistance as possible. If the maximum accuracy is demanded, then the resistance of the leads must be considered. By connecting the milli-voltmeter to (G) and (G') the error due to the leads (T) and (T') is included in the length of the cables under test and a suitable correction must be made. If the galvanometer is connected at the junction of the leads (b) (b') to the cables (A) and (B) then the leads form an extension of the slide wire. In this latter case, the leads being equivalent to a definite number of scale divisions on the slide wire, the scale of the bridge will not then begin at zero, but will start at the figure which corresponds to the number of scale divisions to which the leads are equal. In simplify-

# WESTERN ELECTRICIAN

EVERY SATURDAY.

PUBLICATION OFFICES:
510 Marquette Building, - CHICAGO.
TELEPHONE, MAIN 1746.

Eastern Office, 150 Nassau Street, New York.
Telephone, 4147 John.

Trade Supplied by Western News Co.

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2.50, with free extra copy for eight subscriptions; foreign countries, $5.00 a year; single copies, 10 cents. When change of address is requested, the **old address** as well as the new should be given.

CORRESPONDENCE relating to electricity or any of its practical applications is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—**the only general electrical paper published in the West**—thoroughly covers a territory *exclusively its own*. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring western trade* will appreciate the UNEQUALED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

REMITTANCES.—All checks, drafts and other remittances should be made payable to the order of the publishers, the **Electrician Publishing Company**, and addressed to the offices of publication, Suite 510, Marquette Building (204 Dearborn Street), Chicago, Illinois, U. S. A.

## DATES AHEAD.

National Electrical Contractors' Association (fifth annual convention), Mechanics Hall, Boston, Mass., July 19th, 20th and 21st; electrical exhibition, July 15th to 22d.

Ohio Electric Light Association (annual convention), Hotel Victory, Put-in-Bay, August 16th to 18th.

International Association of Municipal Electricians (annual convention), Erie, Pa., August 23d, 24th and 25th.

Old Time Telegraphers' and Historical Association (annual meeting), New York city, August 29th to September 1st.

American Electrotherapeutic Association (annual meeting), Academy of Medicine, New York city, September 19th, 20th and 21st.

American Street Railway Association (annual convention), Belleve Stratford Hotel, Philadelphia, September 25th to 29th.

THREE electrical bodies hold conventions this week—the American Institute of Electrical Engineers at Asheville, N. C., the Canadian Electrical Association at Montreal and the National-Interstate Telephone Association at Chicago. The sudden and distressing death of Mr. Sheerin at the last-named gathering is recorded on the opposite page. The Western Electrician extends sincere sympathy to the friends and relatives of this sturdy champion of Independent telephony.

THE applications of the discoveries of modern science are numerous, and it may happen that these applications are perverted and made to accomplish ends which are not justified in the eyes of the law. An example of this is the "floating poolroom" which is proposed by gamblers to evade the laws of Illinois against poolroom gambling, which have been enforced with stringency during the last year. The floating poolroom is projected to be located on a steamboat which it is proposed to anchor a short distance out from Chicago in Lake Michigan. It is to be completely fitted with space-telegraph apparatus for sending and receiving massages, and it is expected that followers of the racetrack will come out in large numbers to do the gambling on board the steamer which they cannot do safely in the city. This, surely, is an adaptation of "wireless" which was never contemplated by the inventors.

THOSE persons who believe that the garbage reduction of American cities contains the possibility of a mine of wealth in the way of raising steam for industrial purposes, particularly for driving electrical generators, should read the article on the subject in this issue of the Western Electrician prepared by our London correspondent. In England the street "dust" or refuse is generally of a more favorable character for combustion than the garbage of cities in the United States; nevertheless the results of the undertakings of this character by various municipal bodies in Great Britain have not indicated that, considered economically, the steam-raising possibilities of refuse destructors are to be considered successful. As a destructor of refuse, the apparatus appears to be all right and perhaps a valuable addition to the municipal equipment; but the steam generated is largely in the nature of a by-product, compared with the main purpose of the operation, and is hardly to be relied upon as a steady and economical source of power.

WITH the advance of sanitary knowledge and the consequent precautionary measures to prevent the spread of disease, electric cars as well as other public conveyances are nowadays subjected, and rightfully, to more rigid inspection. Thus, at a recent conference in Indianapolis, representatives of the State Board of Health and of the steam railroads and electric interurban railways prepared a code of rules which will doubtless be formally adopted at a subsequent meeting. Among the rules is one requiring the cleaning of day coaches at the end of each trip, this cleaning to include dusting the upholstering and scrubbing the floors. A sign prohibiting spitting is to be displayed in each car, and at every station in the state of Indiana. Parlor, buffet and dining cars, as well as trolley and street cars, are to be cleaned in like manner, and in addition the food boxes, refrigerators, etc., are to be cleaned and scalded and treated with a one per cent. solution of formaldehyde at least once a week. The rules also contain provisions for the thorough cleansing of sleeping cars.

This joint action is not only another indication of the importance now accorded to electric railroading, but is in line with the best hygiene of the day and deserves the careful attention of all railroad managers.

THIS is the season of the year when the professors, the "old grads" and many other well-meaning friends tender words of advice to the budding engineer as he steps from college halls with all the hopes and fears that the momentous occasion involves. An esteemed contributor who confesses that he is among those "whose recollection of college days is yearly growing dimmer" sends us some reflections on the career of the 1905 graduate in engineering, for which, to our regret, we cannot find space in full. Like those embarking on the uncertainties of matrimony, the young man—and the young woman, too—who is facing the world at commencement is sure of the kindly interest and sympathy of his more experienced fellows. Perhaps the fledgling engineer will feel, after receiving some hard knocks in the inconsiderate world of business, that this sympathy is more academic than practical, but nevertheless the feeling of good will toward the hopeful graduate does exist in widespread degree. Availing ourselves, therefore, of some of the suggestions of our correspondent, we may make a few points of observation that may possibly prove helpful.

For trained, intelligent, hard-working men the opportunities in the technical field are almost innumerable. It is not true that this avenue of endeavor is so overcrowded that there is nothing in it worth while for the inexperienced graduate. Money rewards are small at the beginning, as they should be, for the average embryo engineer has to learn many things after he leaves college. But to the right sort of chap experience comes fast; in a short time—a few months perhaps—he should acquire a certain amount of balance and familiarity with business methods which will lead him to the right perspective of men and things.

Present practice in almost any industrial process may be revolutionized in the next few years. Who can tell? Perhaps the graduates of 1905 may bring about important economies and changes. But if, as is more likely, their work shall consist in widening existing principles and applications, the possibilities of such development are almost unlimited. To cite a few examples in applied science, the use of reinforced concrete in civil-engineering construction, the adoption of electric power in certain classes of heavy railroad service, the increase in the weight, speed and power of battleships, the further development and application of the steam turbine and gas engine, the stopping of financial leaks in every branch of industrial operation—these and many other similar investigations command the best thought of the modern technical expert and offer many unsolved problems.

There is a danger that the graduate will fix his attention too firmly upon following the more technical and highly specialized work of a single branch of engineering, failing to recognize that engineering is a business as well as a profession, and not appreciating the financial bearing of even comparatively small operating and construction details. In far too many cases the simple problems of arithmetic required to be solved in checking up material are neglected on account of a mistaken idea that such work is unimportant in comparison with the determination of the equations of curves and similar questions in which technical education delights. The vital importance of doing even simple work well, of adding straight, and of writing a report in a terse, grammatical style cannot be over-emphasized.

A casual examination of any register of engineering-school graduates shows that many men ultimately cast their lot with very different work from that for which they were directly prepared. No one can foresee the development of his professional or business life in a country like this, and it is well to be not too insistent as to the exact kind of work one takes up, if the financial reward is sufficient, unless one is prepared for sacrifices which many years of activity may not overcome.

In the development of the engineer's career no more important matter can be studied than how to deal with men. Occupying a position naturally appreciative of the problems of employer and employe, the broad-minded engineer is bound to be felt as a force which makes for industrial betterment, not only in iron and steel propositions, but also in the inter-dealings of men. The comprehensive study of public affairs is, therefore, something which ought not to be neglected by the graduate anxious to broaden into a well-rounded professional man, and the influence of the engineer in the great politico-industrial movement of the times has already demonstrated the value of such knowledge

## Sudden Death of S. P. Sheerin at the Opening of Chicago Telephone Convention.

Just as the Western Electrician is going to press come the distressing and saddening news that Mr. Simon P. Sheerin, president of the New Long-distance Telephone Company of Indianapolis, and one of the most prominent Independent telephone men of the United States, was stricken while addressing the National Interstate Telephone Association at the Auditorium Hotel. The meeting was called to order on the day morning, June 20th, at 10 o'clock by James B. Hoge of Cleveland, president of the National Independent Telephone Association, who, with Theodore Gary of Macon, Mo., president of the Interstate association, formed the committee in charge of the present joint convention. Mr. Hoge explained the proceedings be-

S. P. SHEERIN.

which the two associations were consolidated by a joint committee of 10 members, five from each association, which had power to effect a consolidation. The details of the consolidation have already been printed in the Western Electrician. Mr. Hoge then asked the old National association to take action upon the consolidation committee's report, and upon the motion of Col. J. D. Powers of Louisville, Ky., seconded by E. B. Fisher of Grand Rapids, Mich., its action was ratified. The Interstate association had previously ratified the work of its committee, and the consolidation of the two organizations was thus completed.

At 10:15 a. m. Col. J. D. Powers, who had been selected temporary chairman, called to order the first meeting of the National-Interstate Telephone Association. Mr. Powers requested each state represented to select one man, these to constitute the nominating committee, which was to report at the afternoon session. Mr. Powers made no address at this time, saying that he would talk to the association later. He then introduced Mr. Howard S. Taylor, city prosecuting attorney, the personal representative of Mayor Dunne of Chicago, who heartily welcomed the delegates and visitors to the city. Mr. Taylor left no mistake as to his sincerity in offering the freedom and hospitality of Chicago and soon had the convention in a happy state by his humor. He said he was glad the association was organized as "Independent" and that it was founded upon principles of honest competition.

Mr. Sheerin then arose to respond to the welcome from Mayor Dunne. He began:

"On behalf of the delegates present and the 2,500,000 telephone users in the United States whom we have the honor to represent, I thank you most sincerely for this cordial welcome to Chicago. Although the greater number of us only came in on this trip last night, we are by no means strangers in your beautiful city. Chicago has had most intimate relations with the Independent telephone movement since its very inception. Of the $250,000,000 invested in the business, at least $75,000,000 have been spent for switchboards, telephones and other equipment, and I am quite sure it is entirely safe to say that 80 per cent. of this latter sum has been paid to Chicago manufacturers. The Chicago manufacturers, like all other good Chicagoans, have a way of getting there that is all their own."

At this point Mr. Sheerin stepped to Col. Powers and in a whisper said: "I fear I will not be able to finish this." Before the chairman fully realized the situation, Mr. Sheerin reeled and fell heavily backward onto the floor. Physicians were called, but in less than half an hour life was extinct. Apoplexy is believed to have been the cause of death. Mr. Sheerin's address had been prepared in advance, and a melancholy interest will attach to the concluding portion of it—written but never spoken—which is as follows:

"We are glad, however, to be officially assured that we are welcome in Chicago. Your very excellent and enterprising newspapers have carried

[illegible]

We are [illegible] greater or less degree [illegible] me. The telephone [illegible] the [illegible] cost telephone [illegible] today in the world. [illegible] surrounding Chicago and [illegible] there are today [illegible] handling more [illegible] You will not consider me [illegible] that Chicago need [illegible] these 900,000 telephone [illegible] good Chicago. It is a natural [illegible] sity, that should be handled promptly and intelligently.

"We have given proof of the faith that is in us by the work I have indicated. We will spend $1,000,000 to build toll lines into Chicago, just as soon as Chicago is ready to receive them. We want the closest possible relations with you. We will come in and spend our money with you, if you will only kindly open your door.

"Again, sir, I thank you for this most hearty welcome. We are glad to be your guests, and will endeavor so to conduct ourselves as to merit the confidence and closer relationship of our host."

The convention immediately adjourned after this sad incident to meet at three o'clock in the afternoon, at which time some action was to be taken concerning the further progress of the meeting. A further report of the proceedings will appear in the Western Electrician next week.

The convention opened with bright prospects. Most of the prominent men in the Independent operating field, as well as many from the manufacturing, financial and promoting ends, were present. Besides the large number of accredited delegates, telephone men from nearly every state in the Union where the Independent telephone is known were in attendance.

Mr. Sheerin was well known and well liked among Independent telephone men. He was second to no one in his prominence in the movement. He was president of the New Long-distance Telephone Company of Indianapolis and also of the Indianapolis Telephone Company—two of the most prosperous concerns in the Independent-exchange field. He was always active with voice and pen in favor of the movement, and as he was a man of substance and standing, what he had to say was always regarded with attention. He served for some time as secretary of the Independent Telephone Association of the United States—one of the predecessors of the National-Interstate Association. He wrote papers and reports for conventions, and was active in other ways. Formerly he was active in political life, being at one time secretary of the Democratic National Committee. He differed with his party on the free-silver issue, however, and of late had taken little part in politics.

The decedent was a courteous, polished gentleman, kind yet decided in bearing, with strong intellectual powers and the faculty of making and retaining friends. His death will be very sincerely and generally regretted.

## James Dalrymple Returns to Scotland.

After going over street-railway conditions pretty thoroughly for about two weeks in Chicago, and also spending a day or so each in Minneapolis, St. Paul, Cleveland, Buffalo, Philadelphia, Washington, New York, Montreal and Boston, James Dalrymple, manager of the street railway system of Glasgow, Scotland, was scheduled to leave the latter city for home on June 20th. Mr. Dalrymple came to this country at the invitation of Mayor Dunne of Chicago to tell how the street-railway system of Glasgow is conducted by the municipality.

As to Mr. Dalrymple's conclusions about the operation of street railways in America and as to the nature of his advice to Mayor Dunne in the latter's ambition to take over the street railways of Chicago, nothing official is at hand—his views are to be written on the boat and sent to Mr. Dunne—but from his public utterances in various cities it may be concluded that in his opinion the municipal ownership of street railways in this country under present conditions is not likely to be a success.

In one of his last interviews Mr. Dalrymple denied the newspaper reports that he had criticized American politics, but he added that politics is at all times a peril in city ownership. He does not see how public utilities can be operated by Americans under a "spoils system" and he believes a good man at the head of a department should stay there regardless of which party is victorious at election. It is his opinion, apparently, that a change in the methods of municipal government in American cities is essential before any important movement toward municipal ownership should be undertaken.

[illegible]

eral matters

## Entertainment of Electrical Men in Colorado Springs.

[illegible]

guests arrived in Colorado Springs Thursday afternoon and Friday morning, June 8th and 9th. After going to their respective hotels the delegates began the various trips provided for their entertainment, starting from the [illegible] day afternoon [illegible] "classes," each provided with [illegible] distinct color. Each coupon gave admission to some one feature. On Saturday [illegible] excursion to Cripple Creek over the Short Line. A list of these "events" is as follows:

Drive to Cheyenne Canon [illegible]

Electric ride to [illegible] terraden Kaweah [illegible] state of Colorado, stopping [illegible] mines at Austin Bluffs.

Electric ride to [illegible] pass in Manitou [illegible] road.

Drive to the Garden [illegible] estate of General Palmer).

Concert and dance at [illegible] gentlemen on Friday evening). Special electric cars were provided.

Excursion to Cripple Creek, the great gold mining camp, over Short Line (steam) railroad. This was for the whole party and was enjoyed on Saturday. A dainty basket luncheon was served on the train, which was run in three sections and carried about 600 people.

These features were carried out on Friday afternoon, Saturday and Sunday. In addition an informal dance was arranged for Saturday evening in the ball-room of the Antlers. Many, also, remained on Monday and [illegible] trips in the beautiful mountain region about Colorado Springs. Each "class" was in charge of a local chairman and six assistants.

An unusual feature—and one greatly appreciated—was the extending of the full privileges of the clubs to the various delegates and guests of the convention by the El Paso, the Pike's Peak and the Elks clubs of Colorado Springs. This was the first time that the exclusive clubs of that city threw open their doors to every member in attendance at a convention. Particular credit should be given the Town and Gown Golf Club for extending its privileges to the delegates and guests of the association who desired to play golf at any time during their stay in Colorado Springs. The association was given the exclusive privilege of using the links during Friday afternoon, June 9th, at which time a golf tournament was held and prizes of two fine silver cups, donated by President E. H. Davis of the association, were presented to the winners of the two matches, one for ladies and one for gentlemen. Mrs. Percy Ingalls of Arlington, N. J., won the ladies' cup, and Louis A. Ferguson of Chicago the gentlemen's cup.

No charge was made for any of the entertainment features except the ride up Pike's Peak, for which a reduced rate was obtained. The donations for the entertainment were received from the Denver Gas and Electric Company, the Colorado Springs Electric Company and many other electrical companies during business in the state of Colorado, the city councils, the hotels and the business men of both Denver and Colorado Springs, together with liberal contributions from manufacturing and supply companies throughout the United States.

The Colorado people felt that it was a good thing to bring [illegible] West for the [illegible] ciation, and for the first time west of Chicago since 1899, when [illegible] and pleasure, the association officials will, in the future, [illegible] attending a convention at a central western point once every three or four years.

It only remains to be said that the entertainment so liberally provided was on a greater scale than anything [illegible] association. It was thoroughly enjoyed, and the convention will ever be remembered as a red-letter one in every respect.

## Electricity Generating Stations and Refuse Destruction.

[From the London correspondent of the Western Electrician.]

The disposal of town refuse by burning has now been accomplished for many years, and to electrical engineers has been given the credit of having appreciated the modern destructor at its true worth. It is undoubtedly a fact that from the inception of the idea of combining an electricity generating station with a dust destructor—i. e., utilizing the heat produced in the destructor furnaces for generating steam—the cost to the municipality of disposing of their refuse has decreased, and if that were the only point of view from which the matter must be looked at, those concerned would be very contented individuals. But like so many new inventions, the policy surrounding its adoption has given rise to a vast amount of controversy which at the present time in Great Britain is as far from a settlement as ever it was. I notice that in an American popular journal some sweeping statements have recently been made as to what has been done in Great Britain in the matter of combining dust destructors and electricity works, and it is with the object of correcting any false impression that these may be likely to have caused that the following few facts have been collected.

To electrical engineers the question of combining their electricity works with the dust destructors is one of the gravest importance, and with the greater experience in the matter which time brings the hesitancy would appear to be the more pronounced. The most enthusiastic admit that the prime consideration is to dispose of the street garbage in the most sanitary manner. There are in Great Britain at the present something like 200 refuse destructors at work, of which about 50 are worked in conjunction with electricity generating stations. Thus it will be seen that the practice of combining the two is by no means universal, although very fair results have been obtained where the two have been worked conjointly. Leading men here take the view that too rosy an aspect should not be taken of this matter, and the reasons for this are summed up below.

The first instance in which a dust destructor was combined with electricity works was, I believe, at Shoreditch in London. This is a district largely given over to the cabinet and furniture-making trade, and consequently a large percentage of the refuse was comparatively of a high calorific value than is the case in most places. When the Shoreditch plant was first put into operation some glowing accounts were published in the daily papers as to the probability that practically all the electricity consumed in the district would be generated from the steam raised from the burning of the refuse. But Shoreditch is wiser today than it was at the opening of its electricity works, although a considerable quantity of steam is supplied from the destructor boilers. As pointed out above, some 50 other places have followed the example of Shoreditch, but all the wild talk that the public lighting of great cities like New York could be maintained from generators driven from destructor boilers is rather discounted when the average caliber of those towns that have combined electricity works and refuse destructors is taken into account. Not one has the slightest pretension to being a city that may be termed large in the broadest sense of the word. To Glasgow is given the credit of being the most go-ahead city in Great Britain, but there the combination has not been adopted; and the remark applies to other large places such as Sheffield. The real fact is that so many complications are introduced in order to insure smooth working between a dust destructor and the generating station that the results obtained hitherto do not in the opinion of the majority of the independent experts justify its use. It may be said that those engineers in charge of dust destructor generating stations have definite and opposite opinions on this matter. That is so, but there is a qualification to such a statement. In the origin of nearly all municipal electricity undertakings in Great Britain an outside consulting engineer is called in to advise. In many cases before he arrives on the scene the local authority has determined to adopt a combination of the refuse destructor and generating station, and the expert, when advised of this, like a sensible business man, devises a scheme to carry out the wishes of the council. And it is peculiar how deep rooted is the idea of combining the two in the case of the small local authorities. When the consulting engineer has finished his work and the station has been erected a resident engineer is sought to run the combined undertaking. Is it in human nature than an engineer in charge of a works will decry the principle upon which they are erected? Naturally he will try his utmost to make them a success.

However, even from engineers who have been and still are in charge of such undertakings, words of warning have issued quite recently, and it is mainly from these gentlemen that the most valuable cautions have been uttered. In the first place we have been told that the varying character of the refuse makes the steam-raising property a most uncertain factor. Again, the most suitable site for a generating station conducted upon the most up-to-date lines is necessarily not the most suitable site for a dust destructor. Obviously, to avoid too much carting through the streets the best site for a dust destructor would be in the center of the town, whereas with high-tension generation and distribution a certain flexibility exists in the choice of a site for the generating station, which may even be several miles outside the town. Another authority has stated that the fine film of dust which finds its way into the generating station from the destructor is most detrimental to the machinery, and that a high brick wall should be built between the two to avoid this. A further suggestion is that no windows should be built in the destructor house on the side nearest to the generating station. The more drastic opinion was once expressed that there were few engineers who did not regret the combination, if they had charge of it, after four or five years.

On the other hand, the following conclusions given by Mr. W. G. Adams (who is an ardent enthusiast of the combination and not connected with any particular works) before the Institution of Electrical Engineers in London this year show that an indiscriminate advocacy of the combination of a dust destructor and an electricity works is to be deplored—a conclusive answer to those in America who believe that the opposite is the opinion generally held here:

"1. The remarkable figures obtained in some undertakings, as demonstrated in the series of curves I have had the privilege of laying before you, are evidence that great advances have been made in the problem of utilizing waste heat from burning refuse in destructors since the pioneer works were started.

"2. That these results still leave room for substantial improvement—(a) by closer attention to the details of the construction of furnaces and flues and the general arrangement of the plant; (b) by improving the methods of handling and burning the refuse, and (c) by careful utilization of the steam and the adoption of an economical form of blast.

"3. That, given suitable conditions, there is without doubt a substantial gain to be effected by the combination of electricity and destructor works; but owing to the variation in the calorific value of refuse in different localities and to other special local considerations every proposed case of combination needs to be considered on its merits by persons qualified to make an independent and intelligent inquiry."

It should be pointed out that the results described above were not accepted by many other engineers, owing to the difficulty of discovering in the various London works, which were there referred to, the exact method of measuring the units generated from refuse and the units generated from coal.

Without, however, going too much in detail, it will be seen from the above that this matter is a very open one in Great Britain at present. But with modern methods of electric supply there is one factor which may have a very serious effect. Great Britain during the last five years has been "districted" between a number of electric power-supply companies which supply energy for power purposes to manufacturers, and also to local authorities for distribution in detail. Agreements for the latter form of supply are now becoming very numerous, the energy being delivered at a sub-station for transformation. Thus the opportunities for combining destructors and generating stations will tend to diminish rather than increase.

As mentioned before, the object of these few notes is to correct a wrong impression that may possibly be caused by writers in popular magazines as to what are the facts of this matter in Great Britain. As a means of disposing of refuse a dust destructor whether combined with a generating station or not is quite obviously the most sanitary method extant, and if the steam generated by it can be put to some useful purpose the more economical will be the results. But it is not going too far to state that the advantage to an electricity works in having a refuse destructor in conjunction with it is nothing like so great as is sometimes popularly supposed. One fact alone is sufficient to demonstrate this. The refuse is brought in in the morning and must of necessity be burned at once just at a time when, in most works in ordinary localities, the amount of power demanded is very slight. The refuse cannot be stacked for the evening load. Quite a number of places here have electricity works and destructors erected in different parts of the district, and, of course, not connected in any way. G.

## Simplon Tunnel Exposition.

The principal objective point of both the Simplon and the St. Gothard tunnel is Milan, the commercial center of Italy, and for two years past plans have been underway for the celebration of the completion of the Simplon Tunnel, by means of an exposition. The exposition is given under the patronage of the king, who makes a personal contribution of $19,300. The government has voted $96,500, together with valuable concessions and numerous awards. The city of Milan and private subscriptions provided $772,000. It has been decided to give special prominence to transportation and the fine arts. The exposition will open in April, 1906, and continue until November. Transportation exhibits are open to all countries, but the fine arts exhibits will be purely Italian. Harlan W. Brush, United States consul at Milan, says that American manufacturers of anything that can be included under the general head of transportation, including traveling cranes and electric locomotives, should give the exposition early attention.

The boring of the Simplon Tunnel, the largest tunnel in the world, was completed on February 24th. It is the fourth of the great Alpine tunnels, and the second between Switzerland and Italy. It was commenced in August, 1898, and was built by the Swiss and Italian governments. The total cost up to December 31, 1904 (the latest date for which statistics are available), was $13,317,000. The total length is exactly 12 miles and 458 yards. With the completion of the boring, the work of equipping the tunnel was commenced. The lining must be finished, the permanent way built and the signaling apparatus installed. Electric power will undoubtedly be used in the operation of the tunnel.

## Proposed Amalgamation of Harvard University and the Massachusetts Institute of Technology.

The amalgamation of the interests of the Massachusetts Institute of Technology with Harvard University was tentatively decided upon at a meeting of the corporation of the former institution recently, and if the alliance can be consummated without legal complications the corporation of Harvard University is invited to co-operate with the Institute trustees for a union between the two institutions.

A great majority of Technology graduates have been opposed to the alliance, and a vote taken a few weeks ago, it is said, showed that they were against it in the ratio of 3 to 1.

The plan as proposed contemplates that Harvard shall abandon the field of industrial science now cultivated in the Lawrence Scientific School, divert to the Institute all its funds now or hereafter available for this purpose, receiving a minority representation on the executive committee of the Institute, and adding to the Institute faculty its own faculty of industrial science. Students of either may take courses in the other, and "Tech" students may have the use of the Harvard playgrounds, museums, and libraries. The Institute of Technology is to move to Brighton, opposite the site of Harvard College on the Charles River, selling the property it now occupies in Boston. But it is not to lose its name nor the validity of its own degrees. It is simply to do its own work in co-operation with Harvard University.

## Western Union Quarterly Report.

The Western Union Telegraph Company reports for the quarter ended March 31st net revenue of $1,546,087, which, added to the surplus of $15,793,257 on January 1, 1905, leaves a balance of $17,339,344. Dividend of 1¼ per cent., paid April 15th, and interest on bonded debt amounted to $1,517,821, which left a surplus on March 31st of $15,821,523. The net revenues of the quarter ending June 30th, based upon nearly completed returns for April, partial returns for May, and estimating the business for June, will be about $1,750,000. Deducting dividends and interest will leave an estimated surplus for the present quarter amounting to $10,023,202. The executive committee recommends that a dividend of 1¼ per cent. on the capital stock of the company be payable on and after the 15th day of July next, to stockholders of record at the close of the transfer books on the 20th day of June.

## The New "Wunder" Arc Lamp.

The Ball Electric Company of Providence, successor of the well-known Ball system of arc lighting, with the prestige given it by a long series of the electrical field covering a period practically since the inception of the first commercial arc apparatus, presents as the latest product of the close-knit and potential evolved arc lamp called the "Wunder." The lamp has been constructed to burn on 100 to 130 volt direct-current circuits, and is adapted to consume five inches of current, which is the accepted standard. This current may be varied, however, one way or the other, if necessary. Fig. 1 is a general view of the lamp.

Ample provision is made for the dissipation of heat above the arc enclosure to prevent the transmission of any additional heat to the operating works, with its deteriorating effect on the insulated wire of the magnets. The lamp contains an efficient vent for the escape of gases. The supply of oxygen to the arc is restricted in such a manner as to insure long life to the carbon.

None but fire and weather proof insulating material is employed in the construction. The length of the lamp is, over all, 26 inches.

The operation of feeding the mechanism of the

FIG. 1. GENERAL VIEW OF "WUNDER" ARC LAMP.

lamp is actuated by double solenoids with a U-shaped armature, which is connected to a dash-pot and clutch by a rod, the whole being mounted on a central tube carrying the upper carbon holder.

The dash-pot, Fig. 2, is provided with a graphite plunger which is so constructed as to perform its function with the least possible amount of friction, thus insuring positive regulation when in operation.

For the steadying resistance there is used a spiral rheostat consisting of two coils mounted on a porcelain base, and suspended from the top of the lamp. A variable resistance may be obtained to suit the line voltage by means of a device employed for that purpose.

Particular attention is directed to the device for maintaining the inner globe in position. An inner globe with single opening is used. The globe entirely surrounds the lower carbon holder and the single negative rod on which it is supported, and is held in place by a metal cup at the bottom of the globe. This cup is connected to the bottom plate of the lamp by means of a flexible rod controlled in such a way that the globe is not held rigid, therefore responding readily to the variations in temperature. This obviates breakage of the globe due to expansion and contraction resulting from these changes.

The outer globe is spherical in form and is held in position on the lamp by a locking device connecting the band ring surrounding the flange of the globe and the bottom frame of lamp.

The clutch used in this lamp is not complicated, having but one movable part which grips the carbon in a manner precluding all possibility of slipping, and at the same time insuring the proper release of the carbon when the tripping device is brought into action.

It is asserted that the lamp will burn from 150 to 170 hours with one set of carbons. The most satisfactory result in the life of the lamp is dependent upon the quality of carbons used and the amount of current consumed. When retrimming the lamp, the stub remaining of the upper carbon may be used as a lower carbon.

## Operating Features of Vertical Curtis Steam Turbines.[1]

By Arc[illegible]

[illegible]

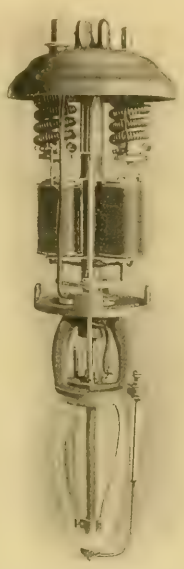

FIG. 2. FEED MECHANISM OF "WUNDER" ARC LAMP.

[illegible]

[illegible]

[illegible]

steam is used for pulp digesters and other heating purposes.

To conform with prevailing practice based on steam engine experience the steam pipes for Curtis turbines have been proportioned for a steam velocity of about 6,000 feet a minute at full load, non condensing. Economy both in capital cost and in operation, however, makes small piping desirable, and there are a number of reasons why the whole of the steam piping for turbine stations should be designed on a different basis. The low velocity mentioned is probably well suited to engine work to avoid vibration of the piping due to the pulsations in flow of the steam and which do not exist in the case of the turbine, and to hold the pressure drop within the economical limit imposed by the engine and give the full pressure up to the point of cut-off. The turbine, on the other hand, takes steam continuously and the maximum flow is the same as the average. A reduction in pressure below that for which the engine cylinder and cut-off dimensions are designed causes a larger increase in steam consumption than in the case of the turbine, whose mode of operation makes it more flexible in this respect. An increase in the pressure drop allowed between boiler and turbines is even more justifiable when the steam is superheated, in order to reduce radiation losses, and involves no increase in initial cost, boilers costing substantially the same whether built for 150 pounds or 200 pounds. The mere increase in pressure from 150 pounds to 175 pounds by gauge reduces the volume by 12 per cent. and permits a six per cent. reduction in the diameter of pipes. It therefore seems desirable to make the rated boiler or safety-valve pressure about 25 pounds higher than the rated turbine pressure and permit a certain variation in pressure under extreme conditions and correspondingly less for normal load, etc., thereby reducing the size of the pipes and fittings and materially reducing the cost of the piping, securing drier steam, avoiding the frequent blowing of pop-valves, and, incidentally, another important advantage, namely, less trouble from leaky steam joints, especially when superheated steam is used.

## Combined Telephony and Telegraphy.[1]

By Samuel G. McMeen.

Perhaps the advantages of combined telephone and telegraph working on the same circuits can be shown more clearly in a picture than otherwise. Fig. 1 is intended to show what is at present possible in this direction. In this figure, it will be seen that over a line of a single wire, using earth as a return, one telegraph and one telephone service may exist at the same time. Over a two-wire line, by one method of operation, one telegraph and one telephone service may be secured at the same time; and this may be accomplished in two different ways so far as the apparatus and principles are concerned.

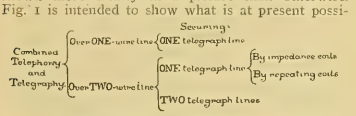

FIG. 1. CHART SHOWING ADVANTAGES OF COMBINED TELEPHONE AND TELEGRAPH WORKING.

By another method of working, a two-wire line may be made to furnish one telephone and two telegraph services at the same time. In all of these arrangements, under proper conditions, there is no interference between the two classes of service. The whole matter of superadding telegraph to telephone service on a one-wire line, or the reverse, may be dismissed by saying that it is not yet shown to be possible to do both things over a single wire without reducing in some degree the quality of the telephone service; the principal commercial application of such a plan is to convert the existing grounded telegraph lines into combined ones, thus securing telephone service of some value, without serious interference with the simplicity and convenience of the telegraph service. This is accomplished by the introduction of certain rather delicate apparatus for signaling, of more than usually powerful transmitters and of receivers of less than usual sensitiveness. A little thought will show that circuits specialized in this way cannot be connected to the standard telephone systems of cities, so that this form of combined working must be considered special, though valuable.

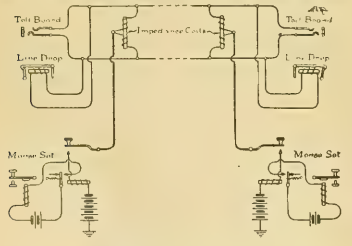

FIG. 2. ONE TELEGRAPH CIRCUIT WITH IMPEDANCES IN BRIDGE.

Combined working over two-wire or metallic circuit telephone lines, however, is free from this objection, and, indeed, from many other very serious ones. I shall try to show what and how important are the limitations which may be expected.

Any metallic circuit telephone line which is good enough for quiet commercial telephone service, may be made to furnish one telegraph circuit by having impedance coils bridged across it, as shown in Fig. 2. These coils should contain turns enough to enable them to be bridged across the circuit with no greater reduction in telephone transmission than would be caused by bridging across a high impedance standard drop or ringer. The magnetic circuit may be opened or closed; that is, the windings may be upon a straight bundle of iron wires, or upon a ring-shaped core. A tap is to be taken from the middle of the winding, or, which is equivalent, from the junction of two similar windings on the same core. This tap is carried to the telegraph apparatus and may be considered simply to be the end of the telegraph line. Any desired arrangement of telegraph apparatus may be added to the circuit thus secured, the only limitation being that the method of working should not involve high frequencies, such as are met in the Edison phonoplex or in any of the high-speed systems of automatic telegraphy.

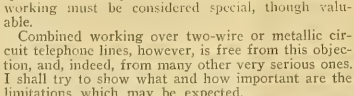

FIG. 3. TAP FOR TELEGRAPH CIRCUIT TAKEN FROM IMPEDANCE COILS.

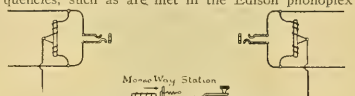

FIG. 4. TELEGRAPH SET IN TAP BETWEEN IMPEDANCE COILS.

Should it be desired to build up a telegraph circuit longer than the available metallic circuit, or to carry the telegraph circuit over a route not already provided with a telephone circuit, the tap for the purpose may be taken from the telephone pair through an impedance coil and into another pair in a similar way. This arrangement is shown in Fig. 3.

If desired, a telegraph set may be inserted at such a point as this, where the telegraph line transfers from one pair to another. Fig. 4 shows this condition.

Should it be desired to insert a pay-station in a telegraph circuit at a point which is not a terminus of a telephone circuit, condensers may be inserted in each of the wires, impedance coils bridged beside them, and the Morse apparatus inserted in the bridge wire which thus emerges from the pair. This arrangement is shown in Fig. 5.

In all the foregoing plans involving the use of impedance coils, there exists the difficulty that in case the two telephone lines so equipped are switched together through a toll board having no condensers or repeating coils in its cord circuits, the two sets of Morse apparatus will be connected together and confusion may result, quite as it does when two telegraph lines become crossed. Inasmuch as condensers of two micro-farads of greater capacity do not interfere with successful telephone transmission, cord circuits so equipped will be free from this fault. For the same reason the loop arrangement shown in Fig. 5 is free from any telephonic objection.

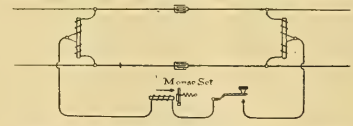

FIG. 5. PAY STATION INSERTED AT A POINT OTHER THAN TELEPHONE TERMINUS.

There is another fault in the impedance coil plan, in that ringing generators, suitable for local exchange line signaling, often require to have one terminal permanently grounded, or to have temporary grounds applied during the time signals are being run upon party lines, grounded rural lines, or other circuits involving ground in any way. If the same source of ringing current is used for toll line signaling, a little thought will show that the telegraph outfit will frequently be disturbed by a series of dots, caused by ringing current passing to ground through the Morse relays.

A preventive for such a derangement is found in providing separate ringing apparatus for toll operators, or by securing the ringing current for these operators through special transformers.

Roughly speaking, the best conditions of operation with the impedance-coil plan will be secured when, with a high resistance total Morse circuit, high resistance telegraph relays are used. It is not required that the resistance of the impedance coils be great, but only that their inductance and consequent choking due to voice currents be great. This is an immediate result of the iron core and the turns. For an expedient, a ringer may be used as such a choke coil, its two terminals being bridged across the telephone line, and a telegraph tap taken by extending the junction between the wires of the two spools. Such an arrangement, if the spools are at all nearly equal, will be quite successful. If a number of circuits are so treated, the ringers of the different circuits must not be stored close together with their cores parallel, or cross-talk between the circuits may result. This may be prevented by placing the adjacent ringers with their cores at right angles to each other.

It is obvious that a high impedance tubular drop having a middle terminal may also be used for such a telegraph tap, and in such a case the danger of cross-talk disappears, being prevented by the shield.

If such high impedance devices as ringers and drops are used for these taps, the Morse relays should be wound to high resistance, say 500 to 1,000 ohms.

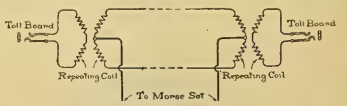

FIG. 6. TELEGRAPH TAP TAKEN FROM LINE SIDE OF REPEATING COIL.

By the use of repeating coils to be permanently inserted in the telephone line at the points where the telegraph tap is to be taken from the circuit, one Morse line may be secured from a two-wire circuit quite as has been described for the use of impedance coils. Fig. 6 illustrates how the tap is taken from the line side of the repeating coil. Coils may be secured in the market with arrangements made for taking out this tap. Connections to Morse apparatus are quite the same as are shown in Figs. 2 and 4. This arrangement has the advantage that no connections between telephone lines in the way of ordinary switching, nor any peculiarities of ringing apparatus, will affect the telegraph apparatus adversely. It has the disadvantage that the introduction of two repeating coils in a circuit causes a distinct loss in both voice and signal transmission, all the more marked when several lines so equipped are connected together. From the practical standpoint, this plan is not recommended for other than short lines, and then only under excellent conditions where freedom from interference is the thing most greatly to be desired.

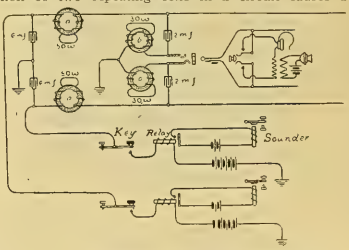

FIG. 7. TWO TELEGRAPH AND ONE TELEPHONE CIRCUIT FROM SINGLE PAIR.

The reason for non-interference between the telegraph and telephone services in either the impedance coil or repeating coil plans is that at any point where telephone apparatus connects to the two wires of the circuit, the potential difference of the two wires due to telegraph currents is always zero.

The arrangement of things shown in Fig. 7 is that which gives two telegraph circuits in addition to one telephone circuit from each pair of wires. The drawing shows the situation far more clearly than it can be described in words. The principle involved is that of different frequencies, the pulsations which make up the telegraph signals being so very much slower than those of the voice currents. When it is remembered that this drawing shows the equipment at one end of the line, and that the distant equipment is an exact duplicate; that the impedance coils (a a) are capable of passing telegraph impulses with little or no harmful effect upon them; that these coils further act with such a choking effect upon voice currents as to be practically opaque to them, and that the condensers of two micro-farads each are relatively transparent to alternating currents and opaque to direct currents, it will be easy to see how the two systems of communication can go on at the same time.

A close examination of the drawing will show that the direction of windings in the coils (a a) is such that the two halves of the total winding are connected in the familiar differential or reverse relation to each other. It will also be noticed that this is not true of the coils (b b). In the coils (a a) therefore, so far as direct currents are concerned, the

1. Presented to the National Inter-state telephone convention of June 20-22, 1905, in Chicago. Mr. McMeen is a consulting telephone engineer in Chicago.

magnetizing effect of one winding of each complete coil neutralizes that of the other, and the alternating current of any frequency, even of that used at the highest frequency used in telegraphic [illegible] work, but no current of such high frequency and small volume as those of speech, the windings of each coil are practically independent of [illegible] coils in use.

While the other arrangements which have been discussed secure non-interference between the two systems of communication by preventing the telegraph from producing any effect at all in the telephone receivers, this plan operates to modify the telegraph signals in such a way that, although they affect the receivers, they do not produce audible sound. A careful examination of the diaphragm of a receiver properly connected across a composite line while the telegraph is working, will show that it is moving through a considerable range, even though nothing whatever can be heard when the instrument is held to the ear.

I have indicated that each of the plans has some disadvantages. The flaw in this plan is that the shunt across the circuit through the coils and condensers is sufficient to prevent any ordinary ringing. Signals from one station to another require to be given over some Morse line, or by the assistance of special apparatus adapted to respond to currents of very high frequency. As the voice current is of a high frequency and can pass over the pair, so some other high frequency, but of larger volume, may be used to operate a relay at the distant station, and that in turn to display a signal. I have no plan to recommend, however, as there is no simple and convenient arrangement available.

The ordinary ringing current is of about 16 cycles per second; a skilled telegraph operator will send 32 dots per second; the half waves of the ringing current are less abrupt in change than the telegraph dot. For these reasons it is apparent that one may send ringing current instead of telegraph current over any composite Morse line without interfering with the telephone. This possibility enables one to sell the service of one side and retain the other for ringing. The arrangement of keys and signals is obvious.

Telegraph circuits secured in any of these ways may be treated as may be desired within reason, in the way of extending by repeaters.

There are three reasons why it is commercially of advantage to apply these composite methods to some of the circuits operated by almost any long-distance organization.

One of them is to secure an additional earning from the property, because by the very nature of things the lines are practically out of use during a large part of each total day. It is not found difficult to secure an annual telegraph revenue equal to five per cent. on the total cost of the circuit, and this without establishing offices or maintaining a special organization to care for commercial messages.

There is more demand for telegraph service in its private line form than is being fulfilled by all the existing telegraph equipment. An active canvass of commercial interests in one's locality, and particularly of those having offices, factories and branch houses in different places, is certain to produce contracts, at a rate less than for other methods, which will supply the consumer with a better result than he is now securing.

The investment on the part of the telephone company per telegraph station, varies with the different plans, but in all cases is only about as great as the cost of the line and equipment of a telephone subscriber located a similar distance from the central office. This statement is meant to cover the complete equipment, including the telegraph apparatus required at the consumer's station.

The second reason is the advantage of ticket wires over which much or all communication between toll operators may take place. Naturally, this enables toll operators to prepare for one conversation over an important circuit while another is going on. An intelligent use of such facilities will enable the carrying capacity of the more remunerative lines to be increased enough to defer the stringing of additional circuits.

The third reason is in the transaction of the official business of the telephone company. By its very nature such a company has its offices scattered about the country, and it is too often its tendency to overburden its own circuits with its official business during the day, while on certain routes there may be too few circuits to carry even the remunerative business of the public. It is inconvenient to force the official business into the less busy hours of the day. A very small investment in composite circuits, and a slight rearrangement of the company's organization, will enable an official to dictate telegrams which the stenographer herself, with a little knowledge of Morse, may place immediately upon the line. Such business may or may not be confirmed by mail. It is not essential that the operators be skilled to high speed, as training in accuracy only is sufficient, and even 15 words per minute is a sufficient rate. Very fast operators reach 60.

If it is not desired to extend the telegraph network over an entire system, official telegrams may be landed in important centers and transmitted by telephone to destination. Experience in this method of handling messages will show that errors are less frequent than might be expected.

## Milo G. Kellogg's Telephone Work.

## Ohio Telephone Notes.

A Toledo syndicate, consisting of James S. Brailey, H. A. Ashbrook, Secor & Bell and others, has purchased a large block of securities of the Cuyahoga Telephone Company of Cleveland. The stock, said to be 10,000 shares, represents one-third of the capital of the company. It was taken at $20, while the bonds, sold upon a basis of something like 86, making the whole transaction over $500,000. The syndicate is to have representation in the directorate, but the company does not pass to its control. It has been announced that there will be absolutely no change in the management and that this was one of the stipulations in the sale. The Toledo people paid more than the stock and bonds were selling for in the market, but because of the rapid growth of the business of the company, they consider they have acquired an interest in a plant that will be one of the best in the country within a short time. The company has $1,500,000 six per cent. cumulative preferred stock and the same amount of common, each having a par value of $50 per share. But $600,000 of the preferred stock has been issued, while all the common stock is out. E. W. Moore conducted the negotiations for the Cuyahoga company, and it is understood that all the money received for the securities will be put into the improvement and extension of the plant. The company on June 1st had 17,127 telephones in use. The surplus for May is on the basis of $150,000 for the year.

Work on the new plant of the Central Union Telephone Company at Columbus will probably be begun about July 1st. The building will cost about $100,000 and will house the exchange, which is to be entirely new, the Columbus district headquarters, the Ohio division headquarters and the district headquarters of the American Telephone and Telegraph Company.

H. W. Lloyd, Edgar Hampton and others have incorporated as the Holland Home Telephone Company of Holland, with a capital stock of $5,000.

The surplus of earnings of the United States Telephone Company for April were $5,838, which is less than for the corresponding month last year, because of an increase in expenses and taxes and the required deductions. The gross earnings were over $3,000 more than last year.

Manager Frank L. Beam of the Ohio Independent Telephone Association, after a trip over the state, expressed his entire satisfaction as to the conditions found. He said there is hardly an exchange that is not behind in filling its contracts. The demand is wonderful, and the growth of the business is assured.

The Grand Rapids Mutual Telephone Company of Grand Rapids, Wood County, has been incorporated with a capital stock of $10,000 by L. E. Carson, E. A. Hall and others.

Incorporation papers have been issued to the New Carlisle Telephone Company, New Carlisle, with a capital stock of $25,000. T. P. Sylvan, T. P. Shelton and others are interested. Another corporation in which T. P. Sylvan is interested is the Home Telephone Company of Mt. Sterling, with a capital stock of $15,000. W. H. Alkire, G. M. Fisher and others are among the incorporators of this company.

The Citizens' Telephone Company of Waterville has been incorporated with a capital stock of $50,000 by J. D. Farnsworth, E. B. Southard, George W. Moss, C. H. McDonough and W. C. Rowe.

The Lowell Farmers' Telephone Exchange Company of Lowell has been incorporated with a capital stock of $10,000 by H. H. Gessel, J. M. Merritt, Jerry Swain and others.

A certificate of incorporation has been issued to the Citizens' Telephone Company of Rock Creek. The capital stock is $4,800, and C. W. Harrington and E. R. Mills are among the incorporators. C.

## Indiana Telephone Items.

The Farmers' Mutual Telephone Company of Patriot, Ind., has filed articles of incorporation with $5,000 capital. The company proposes to establish an exchange in Patriot and will extend the line throughout the eastern part of Switzerland County.

An application has been filed with the Board of Public Works of Marion, Ind., for a franchise for a new Independent telephone company. The company is represented by Marion Evans, a prominent merchant of Marion. Mr. Evans says: "The Independents do not propose to be frozen out in Marion. The company I represent is ready and financially able to build a telephone exchange in Marion for local and outside connections, and will put in a complete system." The application provides for underground conduits within the fire limits and overhead wire in other parts of the city. A 50-year franchise is asked. The price to be charged for dwellings is not to exceed $18 a year, and the maximum charge for business houses not over $30 a year. This application, following so close on the consolidation of the interests of the United and the Central Union telephone companies, is evidence that the Independents are planning to cover the lost field.

The old German Baptist Brethren in national conference at Flora, Ind., have decided that the members should not be permitted to use a telephone in their homes, and those now using them will be requested to have them taken out.

The Central Union Telephone Company will issue new directories at Shelbyville and Crawfordsville. This is made necessary because of the greatly increased number of subscribers to the service.

Judge Welborn of the Posey Circuit Court, has granted the St. Wendell Telephone Company of St. Wendell, Ind., a perpetual injunction against Fred Brune, enjoining him from attaching his private telephone system to the company's line. S.

## Telephone News from the Northwest.

The Beeman Telephone Company of Valley City, N. D., has built 150 miles of lines this year and expects to double that by fall.

Materials have arrived at Groton, S. D., for the installation of a city telephone exchange.

The Nicollet County Telephone Company, with headquarters at New Sweden, Minn., has declared a dividend of eight per cent. The company has bought the system at St. Peter and has established exchanges at New Sweden, Cleveland and Nicollet. Headquarters are to be changed to St. Peter.

A friendly suit will be brought in the Supreme Court of South Dakota to determine the power of taxing a municipal telephone plant. The question will come up from Brookings, S. D., which is operating such a plant.

The Donnybrook (N. D.) Telephone Company will build a number of rural lines.

The International Telephone Company of International Falls, Minn., has been incorporated by Minneapolis capitalists who are developing that point. The capital stock is $50,000.

The Comfrey (Minn.) Rural Telephone Company will construct additional lines this summer.

The council of Redwood Falls, Minn., has finally granted the Tri-State Telephone Company the right to install as many instruments in that city as may be necessary to handle a long-distance business, instead of limiting it to a single connection as first proposed.

It is proposed at Gary, S. D., to increase the capital of the local telephone company and improve the system.

A. Schlaifer and associates have purchased the controlling interest in the Table Rock (Neb.) Telephone Company.

The Northern Telephone Company has purchased the system at Pocahontas, Ia.

The Sagola Telephone Company is constructing a line to Iron Mountain, Mich.

The Brighton Telephone Exchange Company has been granted a franchise at Brighton, Iowa.

The Corn Belt Telephone Company of Waterloo, Iowa, has been incorporated. The capital stock is $300,000. A. T. Averill and S. S. Lichty are interested. R.

## TELEPHONE MEN.

Charles Thomas, who has been with the Beeman Telephone Company of Valley City, N. D., has gone to Moose Jaw, Assiniboia, Canada, where he becomes superintendent of the Moose Jaw Telephone Company.

L. G. Richardson has been formally chosen to the presidency of the Cleveland Telephone Company, and Alexander H. Kirkwood, formerly cashier, has been chosen treasurer to succeed the late J. P. McKinstry. S. E. Fisher was elected auditor and assistant secretary. All the other officers were re-elected. John Sherwin was chosen director to take the place made vacant by the death of Mr. McKinstry.

C. P. Wainman, general manager of the Northwestern Telephone Exchange Company, with headquarters in Minneapolis, has been made vice-president of the company, which operates for the Bell system in Minnesota, North and South Dakota. He has also been made vice-president of the Duluth Telephone Company and of the Mesaba Telephone Company. The office of vice-president has been open since the promotion of H. J. Pettingill to be president at the beginning of the year.

## NEW COMPANIES.

D. C. Perry will establish a telephone line from Elizabeth City, N. C., to Okisko.

The People's Telephone Company of Tehuacana, Texas, has been incorporated with a capital stock of $2,500.

The Scottsburg-Houston Telephone Company has been organized in Scottsburg, Va. J. T. Lacy is president and R. A. Walden, secretary.

At Lawrenceville, Va., the Brunswick Mutual Telephone Company has been organized with $25,000 by L. H. Raney, president; F. W. Davie, secretary-treasurer, and I. E. Spatig, vice-president.

At Rome, N. Y., the Wire and Telephone Company of America has been incorporated with a capital of $600,000. The directors are J. S. Dyett, Rome; S. C. Houghton, Syracuse; and C. F. Niles, Toledo

## Method of Using One Telephone for Two Floors.

A unique device for using a single telephone for two floors is described by Mr. F. Ellwood Smith of Somerville, Mass., in the "Wrinkles" department of the National Electric Light Association. In the case Mr. Ellwood describes the company had been using for two years a separate telephone on the up-stairs and down-stairs floors. During the daytime the down-stairs telephone was seldom used. A box extending from the first floor to the second floor was then made and in this box was placed the up-stairs telephone, arranging it so it could be raised or lowered something like a dumb-waiter. The telephone wires were connected to two brass rods, which extended from the first to the second floor in the box, and connection was made from these rods to the telephone through sliding contacts which were open-arc lamp carbon brushes. A counter-weight was attached. During the daytime the telephone would be at the top, and used in the office on the second floor. At night the telephone would be pulled down-stairs and used there. This has been used for a number of years, and saves the company $75 a year.

## Space Telegraphy in the Navy.

It is said that all the space-telegraph companies except the Marconi, have been given contracts to install their systems on ships of the American navy and at the shore stations. The Maryland and the Pennsylvania are equipped with the Shoemaker system, the Illinois and the Alabama are fitted with the Fessenden system, and the West Virginia and the Colorado are equipped with the De Forrest system. The Telefunken system will be installed at the New Orleans station, and the Massey system will be placed on three shore stations. In each case the contract calls for a communication of 250 miles. The rival companies are confident they will be able to meet the departmental requirements. The Marconi people are still holding out for the exclusive arrangements which they claim to have made with the English and Italian governments. The result is that the Navy Department has made no arrangement with that company, as it has adopted the policy that better results are destined to be derived from rivalry such as that which requires a specified distance in the exchange of messages.

## GENERAL TELEPHONE NEWS.

Stone & Ginn have succeeded to the telephone business of Wall & Head at Edgerton, Mo.

The Pioneer Telephone and Telegraph Company has absorbed the plants of the Long-distance and the Shawnee Telephone companies at Shawnee, Okla., and is putting in a new 2,500-capacity exchange.

The Cincinnati and Suburban Bell Telephone Company has purchased the plant at Independence, Ky., 20 miles south of Cincinnati. The exchange has 150 subscribers. It is stated that no toll charge will be made for Cincinnati connections.

Circuit Judge Shaw has rendered a decision to the effect that the franchise granted the Merchants' Police and District Telegraph Company in Covington, Ky., is invalid on the grounds that the franchise was not advertised for sale, as required by law. This is the company that S. P. Kineon purchased to give him connection with Cincinnati for his Kentucky lines. The case will be carried to the Court of Appeals.

About 30 members of the Missouri Independent Telephone Association met in Sedalia, Mo., recently to revise the constitution of the association, thereby giving greater scope to the Independent companies. The following officers were elected: President, Frank Buffum of Louisiana; vice-president, W. B. Scruggs of Harrisonville; executive committee, Theodore Gary of Macon, J. A. Hudson of Columbia, and F. G. Taggart of Richmond.

The secretary of state recently issued a license for the Rockford and Interurban Long Distance Telephone Company in Illinois. The capital stock is estimated at $30,000. John H. Camlin, E. W. Brown and T. M. Ellis were granted the papers. The extensions will be made to northern Illinois, Wisconsin and Iowa. The first extensions will be made to Beloit, connecting with the Badger State Independent Telephone Company, thence to Belvidere and to Freeport, to connect with western lines extending into Iowa.

The Engineers' Club of Philadelphia has issued a very neat leather-bound book containing a directory of the members of the club and also the charter and by-laws. The book is of handy vest-pocket size and will be found very acceptable to the members of the club.

## New Electrical Water-purifying Device.

A French engineer named Otto [illegible] has been completed a device which can be put up in [illegible] and, by utilizing current from electric-light [illegible] be used as the housekeeper in purifying drinking water. The method, already used by a number of municipal waterworks, is based upon the germ-killing effects of ozone, which is cheaply engendered by electricity. In an electric discharge takes place between two glass tubes, one inside the other, whose surfaces facing each other are coated with metal, ozone is developed in the space between the tubes.

The kitchen apparatus consists principally of a small closed box, the metal cover of which is made conductory with the bottom. In the box is an ozone developer, an interrupter and a tin tube. Through the latter the ozone, which first has to pass through a cotton stopper, to free it from dust and germs contained in the air, is conducted into the water and mixed therewith. If much ozone has been absorbed, the water becomes phosphorescent in the dark. The most important part of the apparatus is the mixer, action of which can be interrupted at will. The apparatus is capable of purifying about 60 gallons of water an hour, it is said, and the cost per hour is about the same as that of an ordinary electric incandescent light.

## Ganz Three-phase System to Be Introduced in America.

The Ganz system of three-phase alternating-current electric traction, which is well known in Europe, is to be introduced in America. This system, for which much is claimed in the way of cheaper initial cost and operation over the existing electric railway construction methods at present in vogue in this country, is to be exploited by the Railway Electric Power Company, in which several New York capitalists and railroad men are primarily interested.

The company has acquired the electric traction patents and manufacturing rights of Ganz & Co. of Budapest. These rights, etc., cover the United States, Mexico, Cuba and all the West Indies other than those under British supremacy.

The board of directors of the company is composed of John E. Borne, president of the Colonial Trust Company; William L. Bull, of Edward Sweet & Co.; Henry Seligman, of J. & W. Seligman & Co.; Stephen Peabody; H. R. Duval, of the Atchison, Topeka and Santa Fe Railroad; Leopold Wallach, of Wallach & Cook; Henry L. Sprague, of Stetson, Jennings & Russel; Gustav Lindenthal, former commissioner of bridges, and Gustave Leve. L. B. Stillwell, electrical director of the Interborough Rapid Transit Company, and Frank N. Waterman are the consulting electrical engineers.

## American Enterprise Appreciated.

The New Orleans and Carrollton Railroad, Light and Power Company, of which Joseph H. De Grange is vice-president, issued a little booklet giving views of its special electrical illumination during the recent Mardi Gras celebration in New Orleans. As readers of the Western Electrician are aware, this illumination was executed in a particularly artistic and pleasing manner and was carried out on a more elaborate scale, perhaps, than anything of the kind previously attempted in the South. One of the booklets fell into the hands of Fred W. Teele, general manager of the Trinidad Electric Company of Port-of-Spain, Trinidad, British West Indies, and he wrote an appreciative letter to the manager of the New Orleans company, from which the following extract will be of interest:

"I certainly think you are to be congratulated upon the result of your work, and also upon the enterprise shown in getting out the illustrated booklet, thus helping your fellow railway and lighting engineers [illegible] from us [illegible] that [illegible] other instances. [illegible] central depots [illegible] pass every [illegible] I am [illegible]

## New Factory of the Universal Electric Storage Battery Company.

In the Western Electrician of [illegible] caption was given of the Manufacturing [illegible] tery, which is being manufactured by the Universal Electric Storage Battery Company, with offices at 1355 Railway Exchange.

This company has recently equipped a new factory, located in Chicago at 36 Union Park Place, which is particularly well fitted to carry out with expedition the manufacture of the batteries. The accompanying illustrations are reproduced from photographs showing sections of two of the floors. The factory now occupies about 50,000 square feet of space and is running day and night at its full capacity. It is thoroughly up to date in all respects. Work is being turned out in a lively manner, and there is a marked air of activity about the place.

The company makes a specialty of batteries of large ampere-hour capacity for car lighting and for heavy electric-truck service, the high-watt efficiency of the Morrison battery making it entirely practicable to build car-lighting batteries of 800 ampere-hours capacity, and larger, and electric-truck batteries of 600 ampere-hours capacity. It is possible to make these batteries of such weights and dimensions as can be conveniently installed and operated.

VIEWS IN NEW FACTORY OF UNIVERSAL STORAGE BATTERY COMPANY.

## "Inner Tip" Incandescent Lamp.

The tip on an ordinary incandescent lamp, which is formed in the sealing-off process, is sometimes the cause of the destruction of the lamp, as the projection is liable to be broken and thus allow the air to reach the interior of the lamp. Various styles of lamp without a tip have been devised, but they are necessarily more expensive to manufacture, since the lamp must then be exhausted through the stem.

"INNER TIP" INCANDESCENT LAMP.

A new lamp which is a compromise between the tipless lamp and the ordinary lamp is one which is illustrated herewith, manufactured by the Missouri American Electric Company of St. Louis, and called the "Inner Tip" lamp. The lamp is covered by patent No. 786,231, issued to Mr. McDonnel on March 28, 1905. In the manufacture of this lamp the air is exhausted in the same manner as in all lamps made by the usual process. After this by the patent process the tip is reversed inside the lamp as shown in the cut. The inner tip so formed is said to be considerably strengthened and there are no thin places in the glass to break and cause a leak. It has the further advantage that there is no projecting point to be broken off in transportation or to injure the hands of those handling the lamps.

The Allan liner Virginia, one of the new turbine boats, recently broke all previous records by the southern route across the Atlantic, having made the trip from Mobile to Cape Race in four days and seven hours.

## Electric Traction in Great Britain, Ireland and Belgium.

[illegible]

[illegible] electricity, and are used instead of comparatively expensive ordinary steam [illegible] there is little traffic, and where it is economical to use lighter rolling-stock which can stand idle in the interval between two successive trains, without costing anything except for the time of the staff, as working expenses.

As one uniform system of electric traction is to be adopted on the English railways, my work will principally consist in showing the different types which characterize the applications of this system on the different electrified lines.

LENGTH OF LINES ELECTRIFIED

| | Length Equipped | | Length Operated or Equipped for Operation |
|---|---|---|---|
| Electrified Sections of Steam Railways | Double Track. | Sidings (Including Sidings) | Double Track. |
| | Miles. | Miles. | Miles |
| Lancashire and Yorkshire railway (Liverpool-Southport) | [illegible] | [illegible] | [illegible] |
| Mersey railway | [illegible] | [illegible] | [illegible] |
| Metropolitan Railway of London | 28.8 * | [illegible] | - |
| Metropolitan District railway | [illegible] | [illegible] | - |
| Northeastern Railway suburban lines north of the Tyne | [illegible] | 82 | 14.9 |

(* Part now being equipped
" Length which is going to be electrified

But there is one common feature which applies to all these cases of electrification, and that is the relative position of the surface of the positive rail, from which the shoes of the vehicles take the current, and of the rolling surface of the track rails. An agreement was arrived at on March 3, 1903, at the London Clearing House, between all the English railways, that, in view of the possible extension of electric traction to lines over which the rolling-stock of several companies runs, the upper surface of the third rail should be placed exactly three inches higher than the rolling surface of the nearest track rail, and that its center should be three feet 11½ inches from the axis of the track.

The electrical resistance of the metal, which is a low-carbon steel, is not more than 7½ times that of pure copper. These rails [Liverpool-Southport line] are supported about every 10 feet; the positive rail is generally laid in the six-foot way and supported on insulators of artificial stone and fastened by two claw plates, bolted face to face, all the plates on one side being first put in place and held by a bolt passing through the insulators till the third rail is put in place; then the second set of plates are put on and the nuts screwed up.

The fourth rail or negative rail is supported on wooden blocks placed between the track rails, which are 30 feet long, and are all bonded electrically at their two ends with the fourth rail. The top

1. Extracts from a report made to the International Railway Congress in Washington. Mr. Gerard is inspector-general of the ministry of railways, posts and telegraph of Belgium.

of the latter is three-fourths inch lower than the rolling surface of the track rails.

Two kinds of electric bonds are used to connect the conductor rails, because there is no expansion gap at each joint, but only at every fifth joint. At the intermediate joints without gaps, the bond consists of strips of copper riveted to the soles and of flat links of copper wire riveted to the web and covered by the fishplates; at the expansion gaps, four sets of flexible strips are bent below the rails and riveted to the soles. The riveting is done by a hydraulic press.

One advantage of the system adopted is that it avoids the necessity of electrically bonding the track rails, as such bonds are subjected to alternating stresses when trains pass and tend to become crystalline and hence brittle; another advantage is that it is possible to repair the track—to take out any track rails in order to replace them without breaking the return circuit.

On the Mersey railway the weight of the positive rail varies between 100 and 60 pounds per yard, according to the amount of current it has to carry. The bonds consist in part of curved copper strips placed below the sole, to which they are riveted at four points by means of a hydraulic riveter; other flat flexible bonds are placed below the cast-steel fishplates.

Every fourth joint is a joint with expansion gaps. In the tunnel, however, where the temperature varies less, expansion is only provided for at every eighth joint. The bonds have a total cross-section of 400 square millimeters (0.620 square inch), part being under the sole and part against the web of the rails. The conductivity of the metals of the conductor rails is one-seventh that of pure copper. The insulators are of glazed earthenware and form six-inch cubes. Those placed below the fourth rail have the same horizontal cross-section, but only half the height. Along the whole length of the positive rail a single line of deals is fixed to it, with wooden packing pieces interposed, as protection.

The use of primary alternating currents makes it possible to locate the power station at a non-central point, favorably situated as regards cost of land, water supply and the handling of the fuel. We shall see that it is in this way that several of the companies which we are considering have dealt with the question. Two of them, however, the Lancashire and Yorkshire and the Mersey railway, were able in each case to install their power station at a point sufficiently near the center of the electrified lines to justify calling them by the old name of "central station." These two companies also use ordinary reciprocating steam engines, with very large flywheels, whereas the others have preferred steam turbines.

*Liverpool-Southport.*—The power station is at Formby, not far from Formby railway station, 10¼ miles from Liverpool, on the banks of the Alt, from which the water required is obtained. Its actual capacity is 12,000 horsepower. The building, which is 280 feet long, is divided into two bays, one, 50 feet wide, containing the boilers, and the other, 65 feet wide, containing the steam engines and the alternators; in each bay there is a 20-ton traveling crane.

In the engine house there are four cross-compound horizontal Corliss condensing engines of 2,360 horsepower each, running at 75 revolutions per minute, able to work with 20 per cent. overload; the flywheel is 22 feet in diameter and bolted direct to the rotor of a 1,500-kilowatt alternator generating three-phase current at 7,500 volts and a frequency of 25. The rotor, the windings of which are of star type, weighs 48,500 pounds, the poles alone (of which there are 40) weighing 12,800 pounds. The stator, which weighs 75,800 pounds, is on a slide, so as to be readily jacked away from the rotor when access to the windings is required. There is also a vertical compound engine working a 700-kilowatt alternator, running at 94 revolutions per minute. The exciting current is supplied by three generating sets, each consisting of a Willans engine and a 100-kilowatt dynamo. A special room, known as the high-tension chamber, contains the switchboard, from which the current is distributed to the four sub-stations, which are situated at Formby, Seaforth, Sandhills and Birkdale, respectively. They receive the primary current through paper-insulated, lead-sheathed cables (the paper of each cable being differently colored, according to phase), armored with galvanized-steel wire. They are tested to 30,000 volts and have a total length of 70 kilometers (43.5 miles). Of the four sub-stations, three are provided with four rotary converters each, and the fourth with only three.

*Metropolitan Railway.*—In order to supply current to the London Metropolitan railway, a power station has been installed at Neasden, which is to the northwest of the metropolis, and where there is a station on the Metropolitan extension, between Baker Street and Harrow-on-the-Hill. This power station, which is to generate from 14,000 to 17,000 horsepower, covers a space of 327 by 101 feet, not counting various subsidiary buildings. This power will be developed by three Westinghouse turbo-alternators of about 3,500 kilowatts each, capable of being overloaded considerably. Room is provided for a fourth generating set. The three-phase alternators, which are designed to supply 184 amperes at 11,000 volts, run at 1,000 revolutions per minute. The four-pole rotating-field magnets give a frequency of 33 1-5 per second. Owing to the dangers which such a speed involves, it is made out of a special quality of fluid compressed steel manufactured by Messrs. Armstrong, Whitworth & Co. Special devices are also provided to keep the windings in place, by confining them between bronze caps. The efficiency of the alternators is guaranteed to amount to 96.5 per cent. at full load, 95.5 per cent. at three-quarters load and 93.75 per cent. at half load.

The turbines, which are of 5,000 useful horsepower each, are of the multiple-expansion double-flow type. With steam at a pressure of 175 pounds per square inch and superheated 180° F., the guaranteed consumption of steam is 17 pounds per kilowatt-hour at full load and 20.25 pounds per kilowatt-hour at half load.

*Metropolitan District Railway.*—The power station which will operate the electric traction service of this railway is located at Chelsea Creek, on the banks of the Thames, and has a frontage on Lots Road.

It is well known that this enormous power station has not been erected for the needs of the Metropolitan District alone, but in order to supply a group of railways which will take current from it at the net cost plus 10 per cent. This group consists of:

| | |
|---|---|
| Metropolitan District railway | 39.95 miles |
| Baker Street and Waterloo railway | 3.65 miles |
| Great Northern and Brompton railway | 7.78 miles |
| Charing Cross, Euston and Hampstead railway | 8.02 miles |
| Edgware and Hampstead railway | 4.04 miles |
| Total | 63.44 miles |

or say 127 miles of single track, without counting sidings, etc.; moreover, arrangements have been made with the London United Tramways Company to supply the current required for its system, which will extend over 75 miles of road.

This remarkable installation is being built on a piece of land having a frontage 1,100 feet in length on the Thames, and another 824 feet in length on Lots Road. The main building is 454 feet long by 175 feet wide and 140 feet high, and there will also be other buildings for offices and other purposes.

*Northeastern Railway.*—The Northeastern Railway did not itself generate current; it has a contract with the Newcastle-upon-Tyne Electrical Company, which has hitherto supplied it with current from one of its power stations, Neptune Bank Central station; but, as this did not suffice, the company recently built the Carville power station, on the banks of the Tyne, which was one of the first in England to use Parsons turbines for driving dynamos. The general plan of this station is designed so as to make large extensions possible. The building which has actually been erected contains the installations necessary for several generating sets—one turbine working a 2,000-kilowatt alternator and two turbines working two 3,500-kilowatt alternators, as well as the corresopnding exciting dynamos. The current generated is at 5,500 volts and has a frequency of 40 cycles when running at 1,200 revolutions per minute.

The steam for the turbines is supplied by 10 boilers working at a pressure of 200 pounds per square inch and superheated 150° F. Mechanical stoking is applied. Each tubular boiler has a direct heating surface of 4,500 square feet and each superheater one of 900 square feet. The grate area is 120 square feet; it is divided into two parts, moved separately by the mechanical gear. Water for condensing is taken from the Tyne by means of Gwynne pumps.

There are five sub-stations. Altogether, they contain 14 rotary converters, with static transformers of 800 kilowatts each, which are distributed in accordance with the amount of power required by the traffic on the sections supplied by the different sub-stations.

### Electric Automobile Cars in England.

Apart from the electrification of some of the lines on its system, the Northeastern Railway Company has, on other sections, put to work some automobile cars to meet certain limited demands in the way of passenger service.

The type adopted, which recalls the principle of the Heilmann locomotives, is as follows: A generating group is placed in a compartment located at the end of a bogie carriage. This generating group consists of a petrol motor with a well-balanced heavy flywheel, coupled generating dynamo and a small exciter; the current operates two series motors, which drive the two axles of the bogie beneath. The running is regulated from one or the other end of the carriage or from either side. A battery of accumulators, of 38 cells giving 120 amperes, is placed in parallel with the exciter and serves both to equalize the lighting and to give a momentary current for starting the petrol motor by means of the dynamo, the armature of which is fixed to the same shaft, and which for the moment acts as motor. When the speed has run up to 420 or 480 revolutions per minute (according to the quickness of start wanted) the current is made to pass to the motors, placed either in series or in parallel. In addition, the exciting current of the dynamo can be varied by the rheostat according to the load. Thus a range of tractive effort and of speed up to 36 miles per hour on the flat is available.

When the handle of the controller has been moved back, it can be moved in the opposite direction, in order to produce electric braking by means of the magnetic brakes, the motors then acting as generators.

The motorman, moreover, for more complete power of regulation, has at each end compartment a rod available, which controls the throttle of the petrol motor.

The following are the chief particulars: Length of car, 52 feet; width, seven feet 11 inches; length of compartment containing the engines, three feet three inches; total weight in running order, 35 tons; there are turnover seats in two rows for 52 passengers; the petrol motor gives 80 useful horsepower. There are four horizontal cylinders 8½ inches in diameter and with a stroke of 11 inches. They are arranged in pairs, opposite to each other, and act on a double-crank shaft. The generating dynamo can give 55 kilowatts. On the same shaft is fixed a well-balanced flywheel three feet in diameter. It drives a 3.75-kilowatt exciting dynamo by means of a belt. On the shaft on the latter there is a second pulley taking the belt which drives a fan intended to cool the cooling water of the petrol motor. The electric motor is the Westinghouse make, of 55 horsepower, the gearing being in the ratio of 18 to 64. The lighting is effected by 24 lamps of 16 candlepower. A small air compressor operated by a one-horsepower electric motor, automatically regulated, supplies the reservoir for the whistle. During the trials the engines and the controlling gear gave every satisfaction.

### Automobile Cars in Belgium.

A commencement was made in 1893 by a six-wheeled carriage with two motors without gearing, with the armature fixed to a sleeve on the axle and connected to the wheels by means of helical springs. With this object, a starwheel was fixed to the sleeve carrying the armature; the four points of this starwheel were connected by eight springs with links fixed to the spokes of the wheels. The field magnets were partly supported by plate springs having small travel, resting on the axle boxes and held against the twisting moment by horizontal rods. The car weighed 25 tons (24.6 English tons), 10 tons (9.84 English tons) of which were the battery.

We may recollect that in these first trials the motors were shunt-wound to facilitate recharging the accumulators when running downhill; but it was found that the amount of advantage derived was extremely small, taking into consideration the disadvantage which results from slow starting.

Five new cars were built in 1896-97 and fitted with compound motors, in order to make it possible both to recharge the batteries by means of the shunt winding and to accelerate the starting by means of the series winding. This was a very difficult problem, but several firms succeeded in solving it, in spite of the additional requirement that if it was found that the shunt was not required, it must be possible to do away with it ultimately and to provide for excitation in series.

In order, moreover, to compare the effect of the different methods of springing the motors, some of the motors were specified to have the armature fixed direct to the axle, and others were specified to have it fixed to a sleeve, allowing play for the axle, the selection of the kind of elastic coupling between the sleeve and the axle being left to the discretion of the contractor.

In spite of all the ingenuity displayed in the different solutions which have been described elsewhere, but would require too much room here, we hasten to state that the dead weight of the accumulators and the limited amount of energy stored in them are but little compatible with the use of such cars on steep gradients, and it is only on steep gradients than any appreciable amount of recharging takes place. Moreover, the two windings lead to complication in controlling the currents for the purpose of regulating the speed, and extreme care is required in constructing the appliances, in managing them and in maintaining them. This was the first lesson drawn from this new series of experiments on the winding of the motors and the regulation of the speed.

The car was used for investigations which gave valuable results. The body has a central gangway with the entrances at the ends, and is carried on bogies; it contains several compartments for second and third-class passengers, with 36 and 40 seats, respectively. In addition, there is standing room for eight passengers in each of the end compartments, so that the car takes altogether 92 passengers. Each of the end compartments is divided into two parts, one of which forms the cab of the motorman. The entrance to the carriage is between this compartment and the central gangway.

In so far as it is a question of trains at rare intervals, on sections where there is no advantage in increasing the number of trains, automobile cars make it possible to realize some economy as compared with trains hauled by steam locomotives. Electric automobile cars have the advantage that the speed can be easily and readily controlled with

great simplicity and certainty from either end of the car without any necessity for turning the car around. Experience will show whether accumulators or dynamos driven by petrol motors give the better result.

## Report on Present Methods of Protection from Lightning and Other Static Disturbances.[1]

By Allen Dow and R. S. Stewart

Transmission lines are occasionally subjected to excessive high-potential strains that would be injurious to generators, transformers or motors, and it is the function of a lightning arrester to protect the apparatus from such strains. These excessive strains are due to the following:

First—Lightning. Lines are seldom struck by a direct stroke of lightning, and when struck the damage is not necessarily serious, if the line is struck some distance from the station, for the line chokes back the discharge. Poles are split by the lightning traveling down them, instead of following the line into the station.

A good example of the action of a direct stroke was observed in Detroit some years ago. One of the street-lighting towers was struck in the daytime, when no current was on the lines, the lines being thoroughly grounded at the station a mile away. As the tower was of iron, the main portion of the discharge evidently traveled down this to earth. Two of the switches at the top of the tower were burned out, the current jumping from the tower to the line, the auxiliary cut-out in one of the lamps was raised and the contacts welded together, showing that a very large current had flowed through this contact. This current then traveled down the line wires to the base of the tower and jumped to the case of the switch at the bottom and from thence to earth. Current also traveled down all four guy lines, splintering all the guy stubs. To one of these stubs a guy line to a telephone pole was fastened. A portion of the current jumped to this line and from there to a trolley wire, puncturing the insulator on the hanger. Nowhere else on the line was there any evidence of damage.

The damage sequent to a lightning discharge is in most instances the work of the induced currents set up in surrounding or adjacent conductors. The potential strain is usually from the line to earth, but may be (and frequently is) between the several wires of a circuit. This latter is more likely to be the case on lines in which the wires are strung some distance apart.

Second—High-frequency waves set up by sudden changes of load or by resonance. These waves are similar to the induced currents from lightning, but the frequency is not so high nor is the potential difference as great. The maximum strain is almost always between the several wires of the circuit.

Third—Static charges. A line insulated from the earth may become charged to a high potential if the climatic conditions are favorable. A very dry atmosphere, hot-wind storms, sand storms and great variation in the altitude of the pole lines are some of the causes of static charges. During severe sand storms the arresters may not be able to keep down the potential of the line, although they may be discharging almost continuously.

The best methods of protection are: Non-inductive high resistances connected from the circuit to the earth; lightning arresters with enough resistance in series with them to prevent the discharges from becoming oscillatory, and overhead ground wires.

Essential features of protective apparatus: They should discharge at a potential slightly higher than that of the system; the ordinary working of the system should not be affected by the discharge; the electric energy of the static disturbance should be dissipated as rapidly as possible; the static waves should be prevented from developing high-potential difference in generators, transformers and other apparatus.

An ordinary spark-gap from the line to earth fulfills the first condition perfectly. The gap can be set to break down at any voltage desired. A spark-gap is dispensed with altogether in some arresters, the line being connected to earth through a non-inductive resistance which is high as compared with the resistance of the rest of the circuit. Water-jet and tank arresters are examples of this.

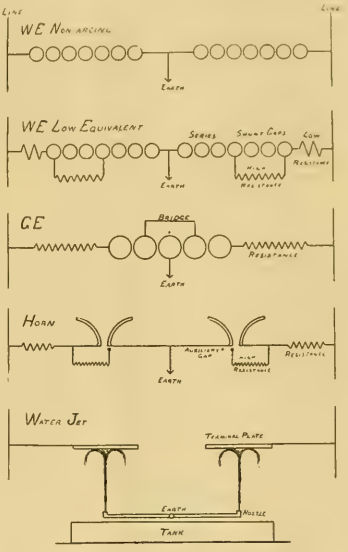
The gap once broken down, the line current will follow unless some means is adopted for preventing this. Inserting resistance in series with the gap, subdividing the gap into several smaller ones, making the metal cylinders between the gaps of some non-arcing material, increasing the size of these cylinders so as to present a large cooling surface for the arc, and blowing out the arc by a magnet are the methods adopted at present.

The third condition is very hard to comply with, as static disturbances differ so much from one another. To protect from a direct stroke of lightning as little resistance as possible should be in circuit. If, however, the line [illegible] the resistance [illegible] the arc to [illegible] resistance in the [illegible]

The fourth condition requires the use of choke coils for [illegible] tion of electric [illegible] due to short circuit [illegible] load.

[illegible] Arresters.

*General Electric Arrester.*—[illegible] one-thirty-second-inch air gaps are connected from line to earth in series with a non-inductive high resistance. Cylinders are large to give a large cooling surface for the arc. The current is kept low by the high resistance used. For protection from stresses between the separate wires of line, half of the gaps are cut out by a bridge connecting the two cylinders which are midway between the line and earth. The arrester thus connected will have the same number of gaps between the lines as from the line to earth. For very high-voltage systems several arresters are connected in series. This arrester should protect very well from ordinary disturbances, but the high resistance does not permit



VARIOUS FORMS OF LIGHTNING ARRESTERS.

of rapidly dissipating the large amount of energy in a lightning flash.

*Westinghouse Arrester for 2,000 Volts.*—Six one-thirty-second-inch air gaps are in series from line to earth. Cylinders are made of non-arcing metal. No resistance is used with this when connected to lines fed by 2,200-volt generators of moderate size. When a higher potential than 2,200 volts is used more gaps are used, and a resistance in connected in series with the arrester to prevent an excessive current from the generator flowing through the arrester. This arrester protects from severe flashes very well, but as the length of air-gap is longer than in the General Electric arrester, a higher difference of potential is required to break down the gap. On discharging a line that has a static charge, oscillating waves may be set up in the circuit, since no resistance is used.

*Westinghouse Low-equivalent Arrester.*—This was designed some five years ago in order to cut down the number of gaps required in the standard arrester when used on very high-voltage circuits. It consists of a small number of gaps which should break down at a little above the line voltage. In series with these is a high resistance, and shunted across this resistance is a second set of gaps equal in number to the first set. In series with the whole arrester is a small non-inductive resistance to keep down the main current. Non-arcing metal is used for the cylinders. The operation is as follows: If the potential of the circuit increases the series gaps break down immediately. As the resistance of these gaps when broken down is small compared with the high resistance in series with them, practically full-potential strain is put on the gaps shunted across this resistance and they will break down. After the static discharge the arc immediately dies out in the shunted gaps if the arrester is properly designed, and the high resistance cuts the current so low in the series gaps that the arc in these is next extinguished. This arrester combines the good qualities of both those already described, for it furnishes a high-resistance path for small static discharges and a low resistance for violent discharges.

[illegible] the iron pole pieces. This field draws up the arc [illegible] furnish high non-inductive resistance paths from the line to earth for any static waves.

Direct-current Arresters.

In direct-current service the arc formed by a discharge is much harder to extinguish than in alternating-current service. Fortunately, however, direct-current voltages are usually small.

[illegible] the single air-gap is between two metallic horns. [illegible] the lower extremity of the gap. This magnet is excited either by the discharge current or by the main-line current. The magnetic field set up blows out the arc immediately. The operation of this arrester is very satisfactory.

*Westinghouse Direct-current Arrester.*—This is built in accordance with the principle that if the voltage across a gap is very low no arc will be maintained in the gap. A large number of minute gaps are connected in series. Carbon particles are used to form the sides of these gaps. It is necessary in this arrester to keep the lines of carbon particles protected from the air, or an arc will be carried across the air above the carbon and will burn up the arrester.

*Garton Arrester.*—Two gaps are connected in series with a non-inductive resistance. Shunted across part of this resistance is a small coil. On discharge the current in the coil lifts an iron armature and increases the length of one of the gaps so much that the arc is immediately extinguished. The most serious objection to this arrester is that it contains moving parts.

*Westinghouse Tank Arrester.*—This was designed many years ago for the protection of large railway stations. Instead of air-gaps, a tank of running water is connected directly from the line to ground. The current taken will be small in comparison with the load. The arrester is disconnected from the circuit, except during thunder storms.

*Choke Coils.*—With all arresters choke coils are placed between the arrester and the apparatus to be protected. A coil of wire offers opposition to the passage of an electric discharge through it. The more sudden the discharge the greater will be the opposition. The opposing electromotive force in the choke coil may be so high that the path across the air-gap of an arrester will be easier than through the coil.

*Distribution of Arresters.*—In long-distance transmission the lines need no protection and the arresters are grouped at the two ends of the line. Several choke coils are used and the arresters are connected to the line at several places between the coils so as to be sure that some of the arresters will be at a maximum point of a static wave.

In distribution networks arresters should be scattered all over the network. There is no general rule as to the number necessary, except that the more arresters installed the better the protection.

In low-voltage networks that are tied together in many places, if one branch extends some distance from the network, weak spots near the end of the branch are punctured by discharges during thunder storms. Experiments with static machines and small networks of conductors showed the same phenomenon many years ago. A static wave traveling down the conductor is reflected back at the end of the conductor. The resultant of the advancing and reflected waves gives at the end of the line a potential strain that is double that of the advancing wave.

The remedy is to put choke coils in the branch at the point where it is connected to the network. The wave in the network will then be divided at the coil, part being reflected at this point and only a small part advancing along the branch.

Overhead Ground Wires.—[illegible] long-distance transmission systems the lines are protected by ground wires strung above the lines. These ground wires are connected to earth every thousand feet. The theory is: If lightning strikes the line the ground wire would be struck directly instead of the line wires that are insulated from ground. As the earth's potential is above and also below the line wires these cannot be charged with static to a high potential. The inductive action of lightning on the line is much reduced, as the

1. Abstract of a paper read before the Denver-Colorado Springs convention of the National Electric Light Association on June 7, 1905. Mr. Dow is manager of the Edison Illuminating Company in Detroit.

ground wire is much nearer the line than the earth.

Discussion (in Abstract.)

E. P. Dillon, Colorado Springs, Colo.: Those of us who are operating in Colorado have our troubles, especially in the zone in front of the foothills, and we feel that lighting is probably more severe in this particular section than in any other part of the state, and we venture to say more severe than we have heard of in other sections of the country. It has required a good deal of attention and study of the peculiar conditions of each system. In Colorado Springs we have a fair amount of protection now, although it is not absolute. We have liberally distributed lightning arresters at various plants and sub-stations, but we have nothing on the line. We do not feel that the placing of lightning arresters on the line is warranted, the risk of having lightning arresters on the line more than offsetting their advantage. We have no ground wire, but I think perhaps a well constructed ground wire would probably obviate some of the difficulties which we have had. Our triangle is not very large, 16-inch centers, no double circuits on the pole line. At three different times in the last two years we have had lines burn down directly in the middle of the span. It seems that the arc starts in some way between the wires, resulting from some sort of a short circuit, and runs along the line until it finds a weak point and burns the copper. Our copper is No. 1, with large engines behind it, with heavy fly-wheel capacity, tending to hold the arc long enough to burn the lines down. This has never occurred on junction poles where you would think the lighting would jump around, but invariably happens on the straight line.

George R. Stetson, New Bedford, Mass.: In the station I had the care of in last December, and after having run direct current for a good many years, and an underground system of transmission for four or five years, an epidemic broke out among our motors that raged for several weeks and in two weeks destroyed more motors than had been destroyed in all the 14 previous years in the operation of our plant. This was an unexpected epidemic with us, and we went to work and treated it as fast as possible, but have not got over it yet. It was a static manifestation. Previous to this we had never found it necessary to make any particular provision for the care of our motors, but at this time the motors were punctured within a radius of three to five miles, one after the other, some being served by the underground system and some being served by the overhead system. The puncture was very much in the nature of a lighting puncture, generally on the armature. At first we were able to repair the armatures within a reasonable time and without much inconvenience to our customers, but it finally went beyond the motors outside, and came into the generators inside, and that was more serious. The singular feature of the matter is the manifestation at this particular time. We immediately went to work to take care of the motors as far as possible by putting up lightning arresters and kicking coils, and seemed to have conquered the trouble to quite an extent, but occasionally we have a manifestation now, particularly if we have not taken proper care of the motors.

I think the Pikes Peak scheme of the tank or water jet resistance in series with the gaps will do the business. I believe we will have some interesting data on that point later.

W. B. Jackson, Madison, Wis.: Regarding the static conditions on transmission lines, some three or four years ago I made a somewhat complete examination of the line in northern Italy, and at that time they had the jet static arresters in use. They were very much troubled by the attacks of static disturbances on their 20,000-volt generators, and they were frequently shut down, as I was informed, not on account of the lightning particularly, but on account of the static going through the insulation of the 20,000-volt machines. They then installed jet static arresters, and I think the arresters had been in about six months. I was informed at that time that since the installation of the water jet arresters, they had no trouble from static effects.

Mr. Dow: Water jets are still satisfactory. Your reporters believe that the water jets are the most comprehensively reliable arrangement that we have just now for protection against either lightning or static discharges when installed in connection with choke coils. The function of the choke coil is to locate the point of discharge for any excessive voltage. The objections to the jets are, first of all, the things are sloppy; and, next, that they take energy. Because of this taking of energy, we make the recommendation that they be held as emergency devices where possible, and upon the appearance of symptoms of static charge on the line the water jets be turned on.

Mr. Stetson's experience with punctures causes me to expect that he had re-action from his machines. I fancy when the short circuit occured that the machines went over, or there was a short circuit of some device on the line, and a quick breaking of a short circuit puts the worst stresses on the line. Mr. Stewart calculated at my request the effect of a short circuit on a certain transmission line we are now building in Michigan. The voltage between the wires on the short circuit will, by calculation, be in that case over 80,000 volts. We are, therefore, not at all anxious to start short circuits, nor break them too rapidly.

## Patent Litigation.

In the case of the General Electric Company, complainant, vs. the Allis-Chalmers Company and the Bullock Electric Manufacturing Company, defendants, alleging infringement of United States patent No. 726,391, Judge Cross in the United States Circuit Court, district of New Jersey, has overruled two demurrers, filed by the defendants, to the bill of complaint. The patent on which the suit is based is known as the Armstrong and Woodbridge patent and involves delta-connected voltage regulation.

To a bill alleging infringement of United States patents Nos. 625,806, 671,287 and 661,049, in which case the General Electric Company is complainant and the Bullock Electric Manufacturing Company is defendant, the defendant filed a plea setting up among other things that since March 1, 1904, it has not made, used or sold any devices of the character alleged by the bill of complaint to be infringements, having on that date leased and surrendered its plants, good-will, etc., to another. Judge Cross of the United States Circuit Court, district of New Jersey, overrules the plea.

The Anderson patent, No. 412,155, covering a trolley contact spring, has been held valid in two cases in which the General Electric Company was complainant and the Garrett Coal Company and the Morgan-Gardner Electric Company, respectively, defendants. Injunctions restraining infringement by the defendants were granted the complainant in both cases, which were heard in the United States Circuit Court, one for the western district of Pennsylvania and the other for the northern district of Illinois.

## Electrical Enterprises in Egypt.

According to a report from the German consul at Alexandria, Egypt presents an excellent field for electrical enterprises, not alone in the cities and towns, but for furnishing motive power for pumping water in the agricultural districts. Egypt imported electric materials to the value of $467,760 in 1904, drawn from the following countries: England, $222,485; Germany, $81,655; France, $41,265; Sweden, $25,960; United States, $25,855, and Italy, Switzerland, Belgium and Austria smaller amounts. The following towns have electric lighting systems, conducted by the companies named: Ismailia, the Société Electrique d'Ismailia; Mansoura, the Mansoura Electric Supply Company; Suez, the Société Electrique d'Ismailia; Tanta, Eugene Nahman & Co.; Port Said, Compagnie Centrale du gaz; Alexandria and Cairo, Compagnie Centrale d'Eclairage par le gaz. Electric-railway lines are operated in Cairo by a Belgian company, the Société Anonyme des Tramways du Cairo, whose share capital is $1,200,000, and in Alexandria by a Belgian company also, the Société Anonyme des Tramways d'Alexandrio, having a working capital of $1,600,000. The Alexandria and Ramleh Railway Company operates the electric railways running from Alexandria to suburban places.

## Foreign Trade Possibilities.

The building of a tramway line in Nankin, China, is projected.

The city of Nachod, Bohemia, Austria, plans the erection of an electric-light plant.

A German national automobile exposition is projected, to be held at Frankfort the coming autumn.

The Italian ministry of public works has granted a concession to construct a tramway line from Rome to Civita-Castellana.

A project has been presented by a member of the municipality of Mainz, Germany, to introduce electric lighting in the principal streets of that city.

The electric central power station in Podgorze, Austria, near Krakow, is to be enlarged and will receive additional motors, steam engines, boilers and electric fittings. Further information may be had from K. K. Staatsbahn-Direction, Krakow.

A new company, Le Central Electrique du Nord, with a capital of $1,200,000, has been formed in Brussels for the purpose of building an electric tramway between the cities of Lille, Roubaix and Tourcoing, France, and branch lines running a total length of 37½ miles.

The Austrian consul at St. Gall calls the attention of Austrian manufacturers to the increased use of electrical contrivances in the hotels of Switzerland, in laundries and elevators, and for ventilating, cleaning floors, beating carpets, etc. Switzerland has many hotels, and offers a big market for the sale of electric machines for such purposes.

The following cities are now issuing bonds to pay for contemplated public improvements, among which are sewerage works, electric plants, etc.; Belgrade, Servia, $2,000,000; Baden-Baden, Germany, $933,000; Giessen, Germany, $814,000; Mülhausen, Germany, $814,000; Regensburg, Germany, $476,000; Offenbach, Germany, $1,190,000; The Hague, Netherlands, $1,200,000.

# CORRESPONDENCE.

## Great Britain.

London, June 7.—The telephone agreement is now being seriously considered by the select committee of the House of Commons appointed for the purpose. The committee is in a different position to the ordinary committee of Parliament, inasmuch as it has no power to make modifications in the agreement, but is only able to make recommendations to the House as to what alterations should, in its opinion, after careful consideration, be made. Up to the present, witnesses from the postoffice have been heard in favor of the agreement, the general opinion being that whereas competition in London did not mean duplication of plant, competition in the provinces would be an unwarranted waste of capital and a duplication of plant, owing to the vastly different circumstances. So far as the proceedings have gone, it is clear that some members of the committee are in favor of an extension of municipal telephony, in preference to a state-controlled system. The officers of the postoffice, however, have put forward some very strong reasons why the municipal systems should be purchased at the same time as the company. Witnesses from the municipalities will be heard later.

Having been constituted by special act the sole tramway authority for London, the London County Council is gradually extinguishing all the remaining small interests of the companies. Up to last year all the companies on the south side of the Thames had been bought up with the exception of two, whose lines were in a more or less derelict condition. Having missed the statutory period at which the lines could be purchased, the council last year was confronted by one of the companies going to Parliament and asking for a revival and an extension of its powers, and also authority to work them electrically. The County Council quite naturally opposed the proposition most strenuously, its attitude being that the lines were not worth purchasing. In the end the committee ordered the council to pay the company a small sum for its rights. This year a similar application was made to Parliament by the remaining company in the south, with somewhat similar results. Taking the above in conjunction with the agreement just entered into with the one company in the north of London the County Council is now in sole possession of all the tramways in the County of London, a fact which should lead to a continuity and uniformity of policy which should augur well for the future.

With the mixed system of steam and electric traction which now exists upon the Metropolitan railway, it was obvious that some method would have to be adopted for hauling the ordinary trains over the electrified portion of the track. Consequently a number of electric locomotives have been ordered, each having four 300-horsepower motors, for hauling the main line ordinary trains over the portion of the track fitted with the third and fourth rails. The locomotives are also to be used for hauling goods trains in a similar manner. Altogether there will be 10 of these locomotives.

The inconsistency of opinion on questions relating to municipal trading between the general body of the members of the House of Commons and those of the House of Lords was well shown a few days ago. A certain provincial local authority obtained sanction from a committee of the House of Commons to supply electrical energy in districts contiguous to its boundaries, albeit there had been no demand for current from any of such districts. In due course the bill came before a committee of the House of Lords, but it was pretty quickly rejected. On the broad principle I think the latter decision is one which ought not to be quarreled with, for the primary functions of a local authority is to supply the needs of its own districts and not to speculate in districts where it has no power to raise rates.

The session of the Institution of Electrical Engineers has now closed and the report of the council has been published. The total membership of all classes is now 5,410, which it is anticipated will be increased to 5,677 by the end of this year. The council has this session elected Prof. Elihu Thomson an honorary member. Among the matters now in hand by the Institution, mention may be made of a sub-committee which has recently been formed for the purpose of entering into correspondence with foreign countries with a view to ascertain their attitude toward the question of international electrical standardization, and, if favorable to the idea—to procure their support in the proposal to form an international standardization.

Gradually all the large electric power companies are getting into working order. The latest company to commence the erection of permanent generating works is the Cleveland and Durham County Power Company, and the first installment of the plant will be 6,000 horsepower. Turbo-generators, of course, will be installed, the voltage being 11,000 and the frequency 25 cycles per second.

An association has been formed called the Incorporated Association of Electric Power Companies, having for its objects the encouragement, expedition and facilitation of the development of the industry of supplying electrical energy for

power and other purposes. The [illegible] of gentlemen interested in [illegible] parts.

## New York.

New York, June 17.—Aldermen [illegible] and Donlil have obtained an [illegible] of the Board of Estimate from acting upon the [illegible] route approved by the Rapid Transit [illegible]. This is part of the attempt of the Board of Aldermen to count the contemplated [illegible] law which takes away from the [illegible] from the aldermen. The alleged motive of the application is to allow the matter to be explained [illegible] public vote.

Nearly all the arrears of the franchise tax have been paid this week and the city has not had to proceed to offer any of the franchises at auction to pay the taxes. Yesterday nearly $3,000,000 was paid over. The Manhattan Railway Company paid $1,888,305, and the Metropolitan Street Railway Company, $774,325. Some of the corporations are trying to offset rentals against the franchise taxes.

The Fourth, or Park Avenue Tunnel, through which the surface cars travel is now in course of renovation. An air-blasting apparatus worked by a motor is taken along the tunnel from point to point, the current being supplied from the trolley conduit circuits. Owing to the limited space for operation, the apparatus has been specially designed not to occupy more than about 15 inches in width, so that it can stand between the car tracks.

The Brooklyn Rapid Transit Company has opened its new line on Wyckoff Avenue, on which there will be ultimately 20 cars running.

Sanderson & Porter, electrical contractors of 52 William Street, have purchased for $1,500,000 the New York and Long Island Traction Company. The road is about 33 miles long and runs from Mineola to Freeport, via Hempstead, passing the new race course at Belmont Park.

The new electropneumatic signalling plant at the Long Island Railroad depot at Long Island City has been put into operation this week after exasperating delays. The plant controls 250 switches and 100 signals, and when first put in some months ago was found to be unworkable. The experience of the last few days seems to promise entire success this time.

The list of the newly elected officers of the New York Electrical Society is as follows: President, W. S. Barstow; vice-presidents, H. G. Stott, P. A. Bates, Max Loenthal, A. F. Ganz, L. B. Marks, W. S. Rugg; secretary, George B. Guy; treasurer, H. A. Sinclair.

The New York Edison Company announces, as from July 1st, a reduction in the price for current to 10 cents a kilowatt-hour. The old pro rata discount on the number of lamps is abolished.

Charles A. Thompson, with several associates, has incorporated as an electrical machinery concern bearing his name, with a capital of $25,000. His associates are James Shaw of Brooklyn and Rudolph Mieling of New York.

The Hallmund-Collbohm Electric Company of this city has been incorporated with a capital of $10,000. The directors are G. B. Rossman and M. H. Collbohm of this city, and H. Dinderichs of Ithaca, N. Y.

The village trustees at Freeport, L. I., have decided to purchase another (making the third) 100-kilowatt generator for the village electric-light plant, the present machines being insufficient for growing local business. D. W. W.

## Southeastern States.

Charlotte, N. C., June 17.—The electric railway from Atlanta, Ga., to Marietta, in course of construction for two years, has just been completed and opened for travel.

The Belton (S. C.) Power Company is progressing rapidly with the new dam over Saluda River and expects to have power in Belton by September, when the town will be lighted by electricity.

E. H. Trafford has submitted a report to the aldermanic committee on finance and electricity of Richmond, Va., in which it is contended that a municipal plant would net the city a revenue of over $78,000 above expenses, the sum of $16,000 to be deducted, however, for interest on $400,000 bonds for construction.

The Salisbury-Spencer (N. C.) Railway Company has been reorganized and elected E. M. Deane of Grand Rapids, Mich., president, and Harry B. Wales of Michigan general manager. It is expected that the line to Spencer will be in operation by July 10th. Extensions in other directions are contemplated.

Immediately after the defeat of a measure put to popular vote to establish a $35,000 lighting plant in the city of Thomasville, Ga., F. D. Dismuke, R. H. Neel and others, composing the light committee, made a present of $3,000 to the city for a lighting plant on condition that the lighting plant should be secured.

The town of Petersburg, Va., is considering the question of municipal ownership of lighting facilities. J. M. Quick is chairman of the light committee.

The Southern Electric Company of Nashville, [illegible]

## Ohio.

Cleveland, June 17.—The Cleveland [illegible] Mansfield Traction Company [illegible] with a nominal capital of $1,000,000, which will later be increased, it is said. W. H. Abbott, A. J. Halle, C. W. Collister, Frank Butler and H. B. Cavanaugh are the incorporators. It is supposed that the interests of the Cleveland and Southwestern and the Ohio Central are behind the [illegible] plan contemplates the use of power from the Elyria power house of the Cleveland and Southwestern.

Surveys are being planned for an extension of the Cincinnati, Georgetown and Portsmouth from West Union to Portsmouth and West Union to Manchester, the latter being a branch seven miles long. J. N. Gardner of New York and Portsmouth and West Union people are at work on the proposition. The line from Cincinnati to Portsmouth will be 95 miles long in comparison with 117 miles for the Chesapeake and Ohio and 107 miles for the Norfolk and Western. Another proposition backed by the same people is the Cincinnati, Toledo and Detroit Short Line Railway Company. It will be 220 miles long and there will be ten county seats on the line besides a large number of small towns. According to an interview, F. E. Seagrave of Toledo will be chief manager of construction, and T. Rhys Smith of New York and Major Walter A. Calhoun will be in charge of the engineering work.

City Solicitor Charles Murphy of Circleville has filed suit to prevent the Scioto Valley Traction Company from laying a third-rail system within the city limits. It is said that the franchise stipulates that the third rail shall not be used in the city.

The public subscription to the stock of the Ohio Northern Traction Company has been closed, the amount for that purpose having been taken is $1,938,000. The stock, which bears five per cent. interest, is said to have been purchased mainly for investment purposes. This is the company that will take over the Cincinnati Traction Company and allied interests.

A franchise for the construction of twenty miles of extensions in Hamilton has been granted the Ohio Northern Traction Company, lessee of the Cincinnati, Dayton and Toledo and the Hamilton lines. At Hamilton $550,000 will be put into a power house, $350,000 on tracks and road construction and $150,000 on rolling stock. The new route in Hamilton eliminates 21 steam-railroad crossings.

City Solicitor Baker of Cleveland has issued an opinion that the council may pass an ordinance regulating lighting rates. There is no law governing this matter, while there is a statute prescribing methods by which franchises shall be granted telephone companies. O. M. C.

## Indiana.

Indianapolis, June 17.—Harry L. Webber, city engineer of Richmond, Ind., has resigned from that position to accept the position of chief engineer for the Fort Wayne and Wabash Traction Company.

The two per cent subsidy tax voted by the property holders in Harrison County to aid in the construction of the extension of the Louisville and Southern Indiana Traction Company's line from New Albany to Corydon, has been placed on the tax duplicate. The work in Corydon was begun last week. The right-of-way extends through the range of hills west of New Albany. An extension is also contemplated to French Lick and West Baden.

The Indiana Railway Company, which largely controls Northern Indiana and Southern Michigan interurban and city traction lines, has let the contract for the construction of a new branch of the system from South Bend to Laporte to George Townsend of Indianapolis. The length of the new line is 29 miles. Mr. Townsend is also building an extension of the Indiana railway system from Niles to Benton Harbor and St. Joseph, Mich.

A meeting of the representatives of the traction lines in Ohio and Indiana, and a committee from the Travelers' Protective Association, is being held in this city to-day to talk over the question of an interchangeable mileage book on interurban lines. It was the Travelers' Protective Association that obtained from the steam railroads the mileage books now in use, and they think a similar book in use on the traction lines would be a great help to the travelers. Several plans are suggested, and the Travelers' Association committee is hopeful of being able to adjust the difficulty now existing between the Indiana and Ohio lines. The present rate of fare on interurban lines is 1¼ cents a mile. It is [illegible] light plant, and bids will soon be asked for [illegible] on electricity by Mr. [illegible] short time until electr[illegible] second lecture will [illegible]

## Michigan.

Detroit, June 17.—[illegible] Commerce [illegible] under [illegible] in the state. It will furnish power for the new electric lines to be built from that city to Adrian and to Lansing. It is a steam plant and it will supplant the company's plants operated by water-power and also be used to provide power for various manufacturing institutions in Jackson. This company is also constructing an office building on West Main Street.

The village of Trenton has made arrangements with the Peninsular Electric Lighting Company of Detroit for lighting the streets. The company will give free service on 20 street lights and connect with private consumers.

The Detroit United Railway of Detroit has been making a good showing and it is said that its dividends are to be placed on a five-per cent. basis at the next meeting of the board of directors.

It is again rumored that a movement is under way looking to the consolidation of all of Detroit's electric suburban lines. They are now all controlled by the Detroit United Railway except the Monroe and Toledo Short Line and the Detroit, Ypsilanti, Ann Arbor and Jackson. The Everett-Moore syndicate, now controlling the Detroit United, it is understood, would like to get hold of these two separate lines, but they are good properties and will consider a cash deal only. The Hawks-Angus syndicate, it is understood, had about sold the Detroit, Ypsilanti, Ann Arbor and Jackson line to the Everett-Moore people in 1901 just before the financial difficulties of the latter and for a good price, too. Now the road is making money, and if sold it will command a good price. H. A. Everett has always wished to see the Cleveland lines connected with those of Detroit and had, before the trouble mentioned, made an arrangement to lease, with option of purchase, the Detroit and Toledo Shore Line (since sold to the Grand Trunk railroad). Since then the Detroit, Monroe and Toledo Line has been built.

The street-railway strike at Saginaw and Bay City still continues and without prospect of settlement. The cars are being operated by strike-breakers under police protection and are very poorly patronized. The sympathy of the people is still with the men. The police were withdrawn for one day to rest up and the strike-breakers refused to take out cars without protection. Owing to the strike the Bay City Street Railway Company has decided to close its summer resort, Wenona Beach, for the season. In Bay City the municipal-ownership idea is gaining ground on account of the strike. An effort is being made to have the city withdraw police protection, without which the company would be unable to operate.

The Jackson Traction Company and its employes have signed an agreement to settle all differences between them by arbitration. C. G. W.

## Northwestern States.

Minneapolis, June 17.—Work is under way on the transforming stations which will form a part of the Twin City Rapid Transit Company's Lake Minnetonka extension. There are to be two stations, one at Hopkins and one at Excelsior. Power is to be transmitted to them at 12,000 volts pressure and distributed over the line at 600 volts. The two buildings will be fitted out with the most modern equipment.

An electric [illegible] been granted at Yankton, S. D., to S. G. Donaldson. A plant will be in operation within 30 days.

A company has been formed to utilize the water power of the Root River at Rushford, Minn., and will construct an electric plant shortly.

It is reported [illegible] Chicago Great Western

Railway Company contemplates operating its trains on the Fort Dodge, Boone (Iowa) extension by electrical power.

The Creston (Iowa) Mutual Electric Light, Heat and Power Company has been formed with J. C. Sullivan as president and J. W. Reynolds as secretary. It will be capitalized at $50,000.

L. L. Stewart of Omaha will install an electric-lighting system at Sumner, Ia.

The Great Northern Power Company of Duluth has recorded a mortgage for $10,000,000 in favor of the Knickerbocker Trust Company of New York. Of this amount $4,000,000 is to be spent in completing the power system.

McArthur Bros. have begun work on the dam for the new power plant at Sault Ste Marie, Mich., for the Edison-Sault plant.

A. G. Moser has resigned as general manager of the Winona (Minn.) Railway and Light Company.

R.

## PERSONAL.

Henry P. Hetherington of Detroit, Mich., has been elected president of the Detroit Public Lighting Commission.

Friends of Arthur S. Ives, civil engineer, in the West and also in Philadelphia, his recent residence, will be interested to know that he has recently accepted the appointment of assistant general manager of the Glamorgan Type and Foundry Company of Lynchburg, Va. Mr. Ives now makes the last-named place his permanent residence.

Announcement is made that deLancey Rankine has been appointed third vice-president of the Niagara Falls Power Company and its allied companies, including the Canadian Niagara Power Company. Mr. Rankine is a brother of William B. Rankine. He is now secretary-treasurer of the Cataract Power and Conduit Company of Buffalo; secretary, treasurer and general manager of the Tonawanda Power Company and the Suburban Power Company. The appointment is made to fill the vacancy caused by the death of the late George W. Davenport.

Frank C. Randall has resigned the position of vice-president and general manager of the National Electric Company which he has held since the early part of 1904, and joined the Allis-Chalmers Company as district manager for the district of New York with headquarters in New York city. Mr. Randall has been closely identified for years with the street-railway supply interests. He belongs in Boston, where he began his business career in the office of his father, who was an importer of special grades of iron and steel. After gaining a couple of years' experience under his father's eye he took up railroading, becoming first the "performance of engines" clerk and later chief clerk of the motive department for all divisions west of Willimantic of the New York and New England railroad. He was afterwards chief clerk of the motive department of the Boston and Lowell road and held this position until the consolidation of the road with the Boston and Maine Railroad. He then entered the shops of the Tripp Manufacturing Company, became expert in the manufacture of electric railway car trucks and rose first to the place of foreman and later to that of superintendent of the works. He left this position to become eastern sales agent for the J. G. Brill Company and was later transferred to the West with headquarters in Chicago. Six years later he accepted the position of eastern sales agent for the Christensen Engineering Company and later became general sales agent for that company and its successor, the National Electric Company, finally becoming vice-president and general manager of that concern. Mr. Randall brings to the Allis-Chalmers Company a valuable knowledge of how to secure business, and of the organization of a selling force. His special acquaintance in the electric-railway field will prove of great value in advancing the interests of the electrical branch of his company.

FRANK C. RANDALL.

## ELECTRIC LIGHTING.

A franchise has been granted to T. R. Osmond for the construction of an electric-light plant in Jacksonville, Fla.

The plant of the Oregon City (Mo.) Light and Water Company has been damaged by fire to the extent of $1,500.

The Prospect Electric Light and Power Company of Columbus, Ohio, has increased its capital from $10,000 to $20,000.

The electric-lighting company of Rio, Wis., is having plans prepared for one 60-inch turbine and one 75-kilowatt alternating-current generator with step-up and step-down transformers. The Milwaukee Engineering Company is the consulting engineer.

The Frisco Ice and Light Company of Granberry, Tex., has been chartered to operate an electric-light and power plant. J. W. Day heads the incorporators.

The Columbia Light and Power Company of Columbia, S. C., has been incorporated with a capital of $10,000 by C. D. A. Spivey, J. C. Spivey and others.

George S. Carson of Iowa City, Iowa, and T. B. Carson of Davenport have purchased the gas and electric plant of the Washington (Iowa) Illuminating Company. The purchase is for $36,500.

The City Council of Aledo, Ill., granted a 20-year franchise to Bollon Bros. on June 14th, and they will begin at once the installation of a $16,000 electric-light plant. W. D. Emerson is the city clerk.

The Algiers Railway and Lighting Company has incorporated at New Orleans, La., with $360,000 capital stock to construct and operate electric-light and power plants, etc. Leigh Carroll is president and L. H. Marrero vice-president.

The city of Cockeville, Tenn., is completing arrangements for the installation of waterworks and an electric-light plant for which bonds were recently voted. Granberry Jackson of Nashville, Tenn., is engineer in charge.

The Campbellsville (Ky.) Electric Light Company has been organized with Dr. J. L. Atkinson, president; J. R. Davis, secretary-treasurer, and B. S. Kincart, superintendent and general manager. The company will operate an electric-light plant.

It is reported that the Southwest Missouri Light Company will make improvements to plant, including one 30-kilowatt 60-volt exciter, one 11 by 11 high-speed automatic self-oiling engine, complete switchboard for sub-station and considerable other machinery. Mr. A. M. Barron is general manager of the company.

## ELECTRIC RAILWAYS.

Hamilton Browne, president of the Newton (Iowa) Northwestern electric railway, has tendered his resignation. Mr. Browne has been for some time engaged in the construction of the Elgin and Belvidere railway in Illinois and will become president of the road.

A new private car for President Huntington and an electric freight locomotive have been turned out by the mechanical and electrical department of the Pacific Electric Railway Company of Los Angeles, Cal. Each has a motive power of 800 horse-power, but the one is geared for high speed and the other for tractive power.

At the last meeting of the stockholders of the York (Pa.) Street Railway Company it was decided to make an extension of the company's line, which will connect the Highland Park division with the South George Street line. The proposed addition will make a complete belt line around the southwestern section of the city.

An electric railway is to be built up Lookout Mountain by S. W. Divine and associates of Chattanooga, Tenn., who have secured the right-of-way along the line of the old "broad-gauge" road which was in operation several years ago. Engineers are now engaged in making preliminary surveys. It is proposed to connect with the interurban line out of Chattanooga, which is to be built via Chickamauga Park to Ducktown.

The Des Moines (Iowa) News says that it is semi-officially announced that the Chicago Great Western railroad is planning the building of short electric feeders along its line, and that it has started this policy by making a proposal for either the purchase or the leasing of the Waterloo and Cedar Valley electric line, operating about 50 miles of electric road. It is stated that the Great Western will electrify its Sycamore branch, a new branch it proposes to build into Creston, and its Zumbrota division between Winona and Minneapolis and St. Paul. Other lines are in contemplation, but have not been decided on as yet.

The Westinghouse Electric and Manufacturing Company has just closed a contract for the equipment of the main generating station and four rotary-converter sub-stations of the Cincinnati Northern Traction Company. The power house will be located at Hamilton, Ohio, and the original installation will be of 5,000-kilowatt capacity, with provisions for ultimately increasing it to 10,000 kilowatts. In the generating station will be located three 1,500-kilowatt and one 500-kilowatt, three-phase, rotating-field, enclosed turbo-type generators and three 300-kilowatt rotary converters. Current will be generated at 375 volts, thus avoiding the necessity of lowering transformers for the main station rotaries. The outgoing lines will then be equipped with raising transformers having a ratio of 375-33,000 volts. Each generator will be driven by a Westinghouse-Parsons steam turbine and excited by a direct-current generator attached to the end of the turbine shaft, from which its power will be derived. Each sub-station will contain a 300-kilowatt rotary converter supplied by 33,000-375-volt step-down transformers. All transformers are of the oil-insulated self-cooling type. Besides the above, the contract includes all necessary switchboards and protective devices for the control and protection of apparatus in the power house and rotary stations.

## TELEGRAPH.

It is reported that the Postal Telegraph-cable Company will begin at once the construction of the telegraph line from Jasper, Ala., to Amory, Miss.

The cable steamer Stephan of the North German cable works of Nordenham is said to have successfully completed the laying of a cable between Menado-Yap and Guam for the German-Holland Telegraph Company of Cologne. The length of this cable is nearly 2,000 miles, and the greatest depth attained 2,300 feet. By this cable the Dutch-India colonies and the German Carolines are placed in communication with the American Pacific cable. The Stephan next proceeded to Shanghai to lay a cable 130 miles in length along the coast, which will form a part of the Shanghai-Yap cable, of which the main line is now being constructed by the North German Cable Works, and which will be laid next winter.

## SOCIETIES AND SCHOOLS.

The National Electric Light Association has received invitations to hold the annual convention of 1906 from Buffalo and New York, but the executive committee has taken no action as to the place of next meeting, and probably will not do so until October of this year.

The University of West Virginia at Morgantown, W. Va., has appropriated $3,000 for new electrical equipment in the engineering department. Mr. William E. Dickinson of New York city, who has recently been elected to be an assistant in the department of mechanical engineering, will install the new equipment.

Prof. F. R. Hutton, secretary of the American Society of Mechanical Engineers, announces that a large number of bids have been received for the construction of the new united engineering building which is to be built in New York city as a result of the contribution of Andrew Carnegie for the housing of the engineering societies. The contract will probably be awarded before this issue of the Western Electrician is printed.

A giant magnet, lifting tons of dead weight, will be one of the things to be seen next month in Mechanics Building at the International Electrical Exposition at Boston. Another interesting and notable feature will be an elaborate X-ray exhibit; also a complete exhibit of medical and surgical electric apparatus. Among the quarry machinery will be seen a model of the great five-motor, electric traveling crane which has recently displaced 10 of the old steam-power derricks in a Vermont marble quarry. The traveling public will be interested in a new electric annunciator for special use at elevated stations, notifying passengers, in advance, of the route, destination and stops that the approaching car or train will make after leaving a station. Then, too, there will be the operation of the new wireless trolley, the invention of a young Philadelphia electrical engineer, which entirely does away with all overhead structures as well as the third rail. Manager Chester I. Campbell reports that space is being rapidly taken, and that the exposition will be an elaborate and successful one.

## PUBLICATIONS.

An original piece of advertising literature is that just issued by the Consolidated Engine Stop Company of New York city. It is in the form of a small booklet setting forth extracts from the opinion of Justice Douglas in the Supreme Court of Rhode Island, relative to a personal injury case in which the Monarch engine-stop system made by the company played a prominent part in decision of the judge. The back cover of the booklet extends above the front cover, the extended portion representing the head and shoulders of a judge, giving a striking appearance to the booklet.

The "Transactions of the International Electrical Congress," held in St. Louis at the World's Fair, have been issued in three volumes. Collectively these three volumes contain 2,843 pages—every page full of the best and latest things in the modern development of electrical science, prepared by world renowned authorities on their several subjects. The transactions take up in alphabetical order the proceedings of the various sections. The books are well printed on a good quality of paper and contain all the diagrams and pictures which went with the original papers, and also several fine half-tones of group pictures taken at the congress. The work is published under the care of the general secretary and treasurer, Dr. A. E. Kennelly, to whom much credit is due for the arrangement of the work.

## POWER TRANSMISSION.

The Orange County Power Company, with headquarters at Port Jervis, N. Y., has been incorporated with a capital of $30,000. The directorate includes W. W. Handy and I. L. Marks of New York and Henry Troy of East Orange, N. J.

The city of Ozark, Ala., is contemplating the construction of a 500-horsepower dam across Choctawhatchie River seven miles from the city and the erection of power plant for the transmission of electricity. Plans and specifications are being prepared by Marvin McDonald, city engineer, who will also supervise the construction.

The York Haven Water and Power Company has decided to make an addition to its plant at York Haven, Pa. Four additional units will be installed in consequence of the demand for more current. The expenditure at this time will be about $100,000. The entire plant will be completed some time next year, when all of the units, which were intended for installation according to the original plans, will be put in.

## MISCELLANEOUS.

At the [illegible] the Schlesinger Works [illegible] fitted with turbine engines [illegible] hour for three months. The [illegible] 2.9 [illegible] foot per hour. [illegible] piston engine averaged [illegible] than the $ 125.

It is said that experiments go to show that the temperature of the atmosphere in the Subway is from three to six degrees higher than on the surface, and from four to [illegible] than in the elevated trains. The observations were taken only at the subway stations, and Chief Engineer W. B. Parsons thinks that the higher temperature is due to the radiant heat from the crowds and from the sunlight through the glass roofs.

Although mica has been found in commercial sizes in about one-third of the United States, it has been mined during the last year only in North Carolina, New Hampshire, Colorado, New Mexico, California, Georgia, South Dakota and Idaho, which are named in the order of their importance as mica producers. [illegible] Hare.

## TRADE NEWS.

[illegible] building [illegible] will deal in electrical [illegible] tracting business. [illegible]

# ILLUSTRATED ELECTRICAL PATENT RECORD.

*Issued (United States Patent Office) June 13, 1905.*

701,998. Resistance for Rheostats and Electric Heaters. Henry P. Ball, New York, N. Y., assignor to the General Electric Company, Schenectady, N. Y. Application filed November 23, 1904.

A metallic electrical conductor having the form of a ribbon ribbed longitudinally, to increase its sustaining power, is wound edgewise into a coil to form a rheostat resistance.

702,014. Transmitting Apparatus for Wireless Telegraphy. John A. Fleming University College, London, England, assignor to the Marconi Wireless Telegraph Company of America. Application filed September 7, 1904.

In a producer of electromagnetic waves are a pair of conducting bodies, separated by a spark-gap, and a motor and connections for rotating one of the bodies, and for causing sparking at successive portions of the body.

702,015. Telegraphic Signaling Key. John A. Fleming, University College, London, England, assignor to the Marconi Wireless Telegraph Company of America. Application filed September 7, 1904.

A movable circuit closer and breaker comprises a lever mounted to oscillate. A continuously-operating motor is provided with means comprising a flexible connecting member for connecting the motor to the lever. A transmitting instrument controls the coupling action.

702,016. Transformer Lead. John J. Frank, Schenectady, N. Y., assignor to the General Electric Company, Schenectady, N. Y. Application filed November 16, 1904.

An insulating bushing is formed of annular members of insulating material, each comprising an inner flanged portion and an outer flanged portion, the inner and outer portions of adjacent members overlapping. A washer is secured between an adjacent pair of the annular members.

702,020. Circuit Breaker and Closer for Alternating Currents. Andrew Gray, London, England, assignor to the Marconi Wireless Telegraph Company of America. Application filed September 7, 1904.

Details are described.

702,022. Electric Furnace. Ernst Haagn, Hanau, Germany, assignor to the firm of W. C. Heraeus, Hanau, Germany. Application filed March 8, 1905.

In an electric furnace is a recess in the wall reaching to near the heating or melting chamber. A conductor piece leads to the heating chamber and engages in the recess near its end face. A conductor also engages in the recess. A metal indicator connects the ends of the conductor piece and the conductor in the recess and is so disposed that it can be watched from without and indicate by its commencing red heat the correct strength of the current.

702,035. Means for Protecting Electric Circuits. John Hamilton, Jr., Boston, Mass. Application filed October 16, 1903.

Combined with an electric circuit is a relay circuit including a visual signal having a circuit closer controlling a second circuit which includes an audible alarm. Means for closing the relay circuit when the difference of potential between two points of the electric circuit exceeds a predetermined quantity, the circuit-closing means including a solenoid device normally cut out from the first-mentioned circuit, are provided.

702,035. Synchronizing Device. John D. Hilliard, Jr., Glens Falls, N. Y., assignor to the General Electric Company, Schenectady, N. Y. Application filed November 23, 1904.

Connected with an alternating-current dynamo-electric machine are a switch adapted to connect the machine to a source of alternating current, a relay comprising two magnet coils energized from corresponding phases of the machine and of the source, a second relay comprising a magnet coil energized with current of a different phase from the current in the other two coils and an electro-responsive device operative upon the simultaneous operation of the relays to close the switch. (See cut.)

702,043. Breaking Device for Electric Motors. Arthur Hultqvist, Göteborg, Sweden. Application filed March 30, 1904.

In an electric-motor circuit are a switching device adapted to change the motor into a generator, a safety circuit adapted to release the switching device, a local circuit and a relay in the latter adapted to close the safety circuit.

702,052. Electric Telegraphy. Isador Kitsee, Philadelphia, Pa. Application filed March 16, 1903.

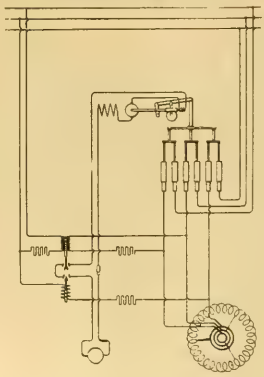
Attached to a recording siphon is a paper adapted to have recorded thereon through the movement of the siphon characters designating the letters of a telegraphic dispatch. An intermediate device is adapted to prevent the depositing of the recording fluid on the paper during the movement of the siphon with the exception of a predetermined period or part of the movement.

702,066. Electrical Harness. William D. McGregor, Slocan, Canada. Application filed December 5, 1904.

An arrangement for a horse's harness is provided with electrode terminals whereby a shock may be communicated to the horse.

702,076. Electric Arc Lamp. Robert H. Read, Schenectady, N. Y., assignor to the General Electric Company, Schenectady, N. Y. Application filed October 10, 1902.

An electric-arc lamp having a lifting magnet and armature for the movable carbon is provided also with means responsive to the lamp current for regulating the arc length. The means are movable independently of the position of the armature and the lifting magnet.



NO. 702,035.—SYNCHRONIZING DEVICE.

702,091. Constant-current System. Matthew O. Troy, Schenectady, N. Y., assignor to the General Electric Company, Schenectady, N. Y. Application filed December 12, 1903.

A constant-current device having relatively movable coils has means external to the device for limiting the flow of current thereto when the device is first put in circuit. Automatically operated means eliminate the effect of the current-limiting means.

702,101. Means for Protection Against Reversal of Energy. Leonard Wilson, Pittsfield, Mass., assignor to the Stanley Electric Manufacturing Company, Pittsfield, Mass. Application filed November 3, 1904.

A series transformer in the circuit to be protected has a core adapted to be saturated by a fraction of the full-load current. A potential transformer, a polyphase torque-producing device connected to the secondaries of the transformers, a switch in the circuit and operative connections between the device and the switch are the other features.

702,102. Alternating-current Motor. Gabriel Winter, Vienna, Austria-Hungary, and Friedrich Eichberg, Berlin, Germany, assignors to the General Electric Company, Schenectady, N. Y. Application filed November 14, 1904.

In an alternating-current motor are a rotary winding provided with a commutator, commutator brushes and connections short circuiting the winding on a number of angularly displaced lines. Means vary the relative resistance of the short circuits.

702,101. [illegible] Water [illegible] rich Eichberg, [illegible] General Electric [illegible] Application filed [illegible]

[illegible] short circuits [illegible] the coils. [illegible] to and [illegible] to the [illegible] and short circuit [illegible]

702,105. Remote Control of [illegible] chines. Jonathan E. Woodbridge, [illegible] land, and John B. Taylor, [illegible] assignors to the General [illegible] Schenectady, N. Y. Application filed [illegible] 21, 1904.

Combined with a [illegible] circuit supplied from the [illegible] means for connecting the [illegible] sumption circuit in proper [illegible] regardless of the polarity [illegible] from four

702,110. Circuit Controller. John M. [illegible] York, N. Y., assignor to the Westinghouse Electric and Manufacturing Company, Pittsburg, Pa. Application filed March 7, 1904.

Associated with an electric [illegible] trolley supplying energy [illegible] for automatically inserting [illegible] with the motor when changing [illegible] supply voltage. The resistance is [illegible] while the motor generates a voltage [illegible] lower supply voltage.

702,120. Constant-current Regulator. Frank Conrad, Edgewood Park, Pa., assignor to the Westinghouse Electric and Manufacturing Company, Pittsburg, Pa. Application filed January 20, 1903.

Combined with an iron core are a primary [illegible] and movable secondary windings. [illegible] Means for overbalancing the weight [illegible] winding and means for partially [illegible] weight of the other are provided.

702,122. System for Transmitting Electric Currents to Cars. John J. Eagan, San Francisco, Cal. Application filed February 2, 1905.

In a railway current transmission system [illegible] on one side of the road, which have a channel for wires Perpendicular rods are affixed to the [illegible] for connection with the wires. Trolleys, pivotally connected to the ends of the car are provided with springs at their outer ends for grasping wire. A wire connects the ends of the trolleys.

702,102. Electric Osteophone. La Forest Potter, New York, N. Y. Application filed June 15, 1904.

An electric osteophone consists [illegible] energy, an electromagnetic vibrator in circuit therewith, head contacts electrically connected with the make-and-break members of the vibrator, and means for engaging the contacts in position for directing the electric current through the head.

702,174. Electric-railway Switch-operating Device. Charles W. Squires, Springfield, Mass. Application filed May 10, 1904.

A track solenoid and a switch [illegible] are connected to a normally [illegible] solenoid. A pair [illegible] normally [illegible] the power circuit, a primary [illegible] core and a pair of electrically connected resilient members carried by the core for engaging and electrically connecting the terminals are [illegible]

702,178. Electrically Propelled Carrier. William J. Sumner, Holyoke, Mass., assignor to the Coburn Trolley Track Manufacturing Company, Willimansett, Mass. Application filed November 14, 1904.

Combined with an overhead trolley track are one or more trolley heads bearing thereon, traction devices on one of the heads to impart movement to the latter in either direction, a platform suspended from the head arranged transversely of the track, a motor on the platform and driving connection extending from the motor to the traction devices.

702,191. Galvanic Battery. Benjamin J. Blamenser, Chicago, Ill. Application filed August 1, 1902.

A galvanic battery comprises elements, one of which is provided with a shell and a rod axial in the shell

but spaced from it. The other element is a cylinder inclosing the rod within the space between the rod and shell. A porous cup having inner and outer walls spaced apart produces a chamber within which the cylindrical element is held.

792,196. Rotary Mercury Circuit Breaker. Adolph F. Christmas, Pittsburg, Pa., assignor of two-thirds to Frank R. McFeatters, Wilkinsburg, Pa. Application filed September 23, 1904.

A circuit interrupter comprising a rotatable body provided with two or more chambers insulated from each other carries a body of mercury in each of the chambers but only partially filling them. Annular conducting faces are exposed in at least two of the chambers, the wall or partition between the chambers being provided with an opening or openings through which the mercury in the two chambers will come into contact at intervals in the rotation of the body.

792,225. Wall Plug for Incandescent Electric Lamps. Charles J. Malish, Toledo, Ohio, assignor of one-half to Louis Bergman, Toledo, Ohio. Application filed October 31, 1904.

A two-part body portion composed of suitable insulating material has corresponding recesses in the meeting faces of the two portions. Detachable axially disposed pivotal connections are placed between the two parts of the body portion, also a pair of contacting metal rings in the meeting faces of the two parts of the body portion.

792,248. Induction Coil. George A. Campbell, Newton, Mass., assignor to the American Telephone and Telegraph Company. Application filed October 8, 1904.

A repeating induction coil composed of two insulated conductors wound over an iron core contains a conducting shield for each winding. An outside conducting shield surrounds both windings and their associated shields.

792,255. Electric Furnace. Francis A. J. Fitz Gerald and Peter M. Bennie, Niagara Falls, N. Y. Application filed December 3, 1904.

An electric furnace comprises independent consecutively disposed compartments and resistors, arranged to heat the compartments, electrically connected in series.

792,257. Low-water Alarm. Addison E. Gardner, Milan, Mich., assignor to George W. Kennedy, Jackson, Mich. Application filed March 17, 1905.

An electric alarm, the circuit of which is controlled by contacts which are closed by the movement of a tubular expansible member, is the feature of novelty in the invention.

792,258. Valve Apparatus. Frederick Grinnell, New Bedford, Mass., assignor to the General Fire Extinguisher Company, New York, N. Y. Application filed July 11, 1899.

Combined with a manually operated valve through which fluid is supplied are an electrically operated indicator, an electric circuit therefor, a switch in the circuit and means operated by the valve-actuating mechanism for operating the switch when the valve is moved from the open position.

792,264. Telegraph Apparatus. Paul E. Heina, Paris, France. Application filed September 12, 1903.

A telegraph apparatus for simultaneous transmission, on a single line, of alternating currents whose respective frequencies are different is the basis of the patent.

792,279. Electric Block-signaling System for Railways. Claud D. McPhee, Arnprior, Canada, assignor of one-half to John Carling Kelly, Ottawa, Canada. Application filed July 1, 1904.

In a signaling system are combined with the block of track in front of a station two adjacent blocks on each side. Electric circuits at the near end of the adjacent sections are closed by the axles and wheels of the locomotive in the section.

792,307. Process of Electrodepositing Antimony. Anson G. Betts, Troy, N. Y. Application filed May 20, 1904.

The process of electrodepositing antimony consists in electrolyzing a solution containing antimony trifluorid with a suitable cathode.

792,315. Self-soldering Heat Coil. Frank B. Cook, Chicago, Ill. Application filed April 13, 1905.

A metal tube carries a pin secured within the tube by heat-susceptible material. Insulating washers are suitably secured upon the tube. Heat-producing means are placed upon the tube between the washers and a corrugated sheet-metal shell is mounted upon the washers and incloses the heat-producing means.

792,404. System for Unlocking Safes or the Like. William W. Dean, Chicago, Ill., assignor to the Consolidated Fire Alarm Company, New York, N. Y. Application filed August 10, 1903.

Electromagnetic unlocking mechanism is attached to a safe, it being responsive only to currents of a distinctive character. Means for applying the currents to the mechanism are provided.

792,425. Electric Cut-out Box. Anton T. Kliegl and John H. Kliegl, New York, N. Y. Application filed August 4, 1904.

Combined with a casing having an inclined wall are one or more sockets supported in an inclined position on the wall, contacts in the inside of the sockets and a plug having contacts arranged to engage those in the socket.

792,435. Lightning Arrester. Charles T. Mason, Sumter, S. C., assignor to the Sumter Telephone Manufacturing Company, Sumter, S. C. Application filed November 23, 1904.

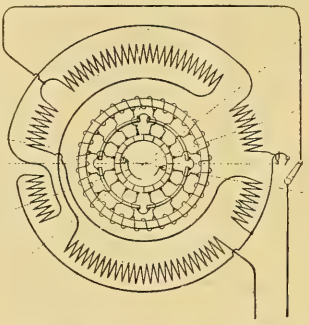
A lightning arrester comprises a sinuous conductor, a grounding shell of conducting material surrounding the conductor and isolated sections of insulation separating the conductor and shell.

792,466. Alternating-current Motor. Leo Schüler, St. Louis, Mo. Application filed June 17, 1904.

In an electric motor is a member provided with a circuit producing definite poles therein. A second member, a conductor on the second member forming poles for producing torque in a given direction and means for excluding a portion of the conductor from effective operation to shift the poles of the second member to a position producing torque in the same direction are the other features. (See cut.)

792,467. Method of Operating Alternating-current Motors. Leo Schüler, St. Louis, Mo. Application filed July 5, 1904.

Operating alternating-current motors is accomplished by producing a given angular displacement between the poles of the respective members to produce torque in one direction, shifting the poles of one of the members to a second position producing torque in the same direction and changing the circuits of the other of the members before synchronous speed is exceeded.



NO. 792,466.—ALTERNATING-CURRENT MOTOR.

792,489. Street Indicator. Carl H. Bailey, Leavenworth, Kan. Application filed December 17, 1904.

The rachet mechanism which moves the register is controlled by a pawl which is operated by a solenoid.

792,528. Wireless Telegraphy. Guglielmo Marconi, London, England, assignor to the Marconi Wireless Telegraph Company of America. Original application filed October 13, 1903. Divided and this application filed January 27, 1904.

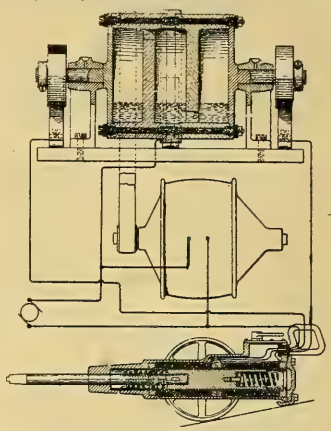
A method of selectively detaching electromagnetic waves consists in associating an open circuit and a resonant circuit and simultaneously altering the inductance of both circuits without altering the sum of the inductances of the two circuits.

792,530. Electric Fuse. Norman Marshall, Newton, Mass. Application filed June 27, 1903. Renewed May 20, 1905.

An electric fuse or cut-out contains a main fuse wire, an inclosing casing having an opening through its wall, a cup extending through the opening and an auxiliary fuse wire within the casing and passing through the cup.

792,569. Electric Railway. William Chapman and Percy W. Davies, Pittsburg, Pa., assignor to the Westinghouse Electric and Manufacturing Company, Pittsburg, Pa. Application filed November 23, 1897. Renewed April 12, 1905.

The electric railway system comprises track rails, a feeder, conducting sections and electromagnetically operated switches for making connections between the conductor sections and the feeder. Each of the switches comprises a magnet having one or more shunt pick-up coils and one or more series holding coils. An auxiliary solenoid has a core to open the pick-up circuit when the main circuit is closed and a valve that is automatically closed when the core is electromagnetically actuated and is opened by the reverse movement.



NO. 792,571.—ELECTRIC MOTOR SYSTEM.

792,571. Electric Motor System. Adolph F. Christmas, Pittsburg, Pa., assignor of two-thirds to Frank R. McFeatters, Wilkinsburg, Pa. Application filed September 23, 1904.

A reciprocating motor is provided with one coil for giving the working stroke and another coil for giving the return stroke. A circuit interrupter and changer are arranged to break the circuits and make them alternately through the coils, the circuit interrupter and changer being provided with adjustable means to vary the time at which one or both of the coils is energized. (See cut.)

REISSUE.

12,356. Reciprocating Electric Engine. Bruno O. Wagner, El Paso, Texas. Application filed April 20, 1905. Original No. 783,001, dated February 21, 1905.

In a reciprocating electric engine are a metallically inclosed magazine of iron rings and interposed solenoids forming periodically and in sequence actuated electromagnets. A rotary controller opens and closes progressively circuits through the electromagnets and reverses the direction of the oscillating field when the armature is to reverse its stroke.

## EXPIRING PATENTS.

Following is a list of electrical patents (issued by the United States Patent Office) that expired on June 19, 1905:

384,638. Dynamo-electric Machine. R. Oliver, Alpena, Mich.

384,644. Multiple Switchboard Testing Apparatus. C. E. Scribner, Chicago, Ill.

384,662. Magneto Electric Fuse. E. L. Zalinski, U. S. Army.

384,663. Projectile. E. L. Zalinski, U. S. Army.

384,676. Automatic Electric Gas Cut-off for Railroad Cars. F. C. Brower, Syracuse, N. Y.

384,685. Electric Railway. S. D. Field, Yonkers, N. Y.

384,775. Electromagnetic Parcel Carrier. M. C. Mengis, York, N. Y.

384,810. Automatic Electric Block Signal System. T. D. Williams, Alleghany City, and J. S. Lucock, Bellevue, Pa.

384,676. Apparatus for Operating Automatic Block Signals. T. D. Williams, Alleghany City, and J. S. Lucock, Bellevue, Pa.

384,815. Incandescent lamp socket and switch. J. J. Wood, Brooklyn, N. Y.

384,816. Commutator for Dynamo-electric Machine. J. J. Wood, Brooklyn, N. Y.

384,817. Electric Arc Lamp. J. J. Wood, Brooklyn, N. Y.

384,830. Railway Signaling. T. A. Edison, Llewellyn Park, N. Y.

384,856. Electromagnetic Time Lock. C. J. Kintner, New York, N. Y.

384,875. Electric Fire-alarm Apparatus. G. M. Stevens, Cambridge, Mass.

384,901. Guard Rail and Insulator for Electric Railways. H. A. Foster, Boston, Mass.

384,908, 384,909, 384,910, 384,911 and 384,912. Electric Railway. R. M. Hunter, Philadelphia, Pa.

## SPECIAL MENTION.

"Where Health and Pleasure Wait" sounds inviting as vacation days approach and the feeling is strengthened by reading about and studying the beautiful pictures of mountain, lake and stream which are reproduced in the handsome new folder issued under the above title by the New York Central lines, being No. 2 of the Four-track Series. The folder is prepared in a breezy, agreeable style and describes the resorts of New England, the Berkshire Hills and Canada, which are reached by the New York Central lines, and which offer the finest opportunity for recreation during the summer months. The public, by this number of the Four-track Series, is given an idea of a lot of places that are easily reached, and which will suit a variety of tastes.

Many interesting things are to be learned about ropes, their manufacture and uses, from the new catalogue of the C. W. Hunt Company of New York, entitled, "Manila Rope Transmission and Hoisting." The catalogue contains a treatise for engineers upon ropes used for transmission of power, together with formulas, data and tables useful in mill engineering. The catalogue is well illustrated and the information which it contains will be found of much value.

The New York Central and Hudson River railroad, under date of June 13th, announces important changes in time for the summer schedule which took effect June 18th. Train No. 11, Southwestern Limited, will leave New York at 2:04 p. m. and arrive at Buffalo 11:37 p. m., Cincinnati 10:30 a. m., and St. Louis 5 p. m. Train No. 25, the Twentieth Century Limited, 18 hours from New York to Chicago, will leave New York daily at 3:30 p. m. and arrive at Chicago 8:30 a. m. Train No. 26, the Twentieth Century Limited, 18 hours Chicago to New York, will leave Chicago, via Lake Shore and Michigan Southern railway daily at 2:30 p. m., and arrive at Grand Central Station, New York, at 9:30 a. m. Several other changes have been made, but the notable ones are those cutting two hours from the time between New York and Chicago, by which the distance is now covered in 18 hours.

The Couple Gear Freight Wheel Company of Grand Rapids, Mich., has been incorporated and filed articles of association with capital at $500,000. The company will manufacture as licensees the gyroscope type of wheels (see Western Electrician of February 20, 1904) for electric trucks and delivery wagons under the Holson Motor Patents Company of the same city. About $80,000 will be invested in buildings and equipment. The president of the company is M. B. Church.

AMERICA'S STANDARD

AND THE METER THAT
LEADS IN THE ART

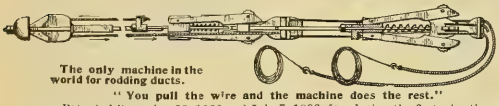
DUNCAN ELECTRIC MFG. CO.

LA FAYETTE, IND.

# COPE'S UNDERGROUND ELECTRICAL SPECIALTIES

## THIS IS WHAT WE HAVE

### PATENT CONDUIT THREADING MACHINE



**The only machine in the world for rodding ducts.**

**"You pull the wire and the machine does the rest."**

Patented December 30, 1890 and July 7, 1896, for placing the first wire through electrical or other underground conduits. These machines have been successfully used several years, but the improvements of 1896 make it much easier working and simplify its whole construction. This device threads conduits of any material such as iron, wood, cement or terra-cotta, of any shape or size from 1 to 20 inches in diameter. Can be worked from surface of street, thus avoiding the gases, or within the manholes.

Is pliable and can be bent to enter or to be withdrawn from manholes or hand-holes 15 inches in diameter. Have run "ducts" 1,300 feet between man-holes. Will pass through mud in "ducts" 100 feet from entrance, that cannot be penetrated any other way.

### PATENT QUICK COUPLING CONDUIT ROD

Made of Steel in the BEST POSSIBLE MANNER

Made in 3 ft. and 4 ft. lengths of carefully selected hickory and are passed through three processes of toughening before being used.

These rods should not be compared with inferior ones thrown on the market by parties unfamiliar with the requirements of rods. A good rod is worth ten inferior ones. Our 16 years' experience guarantees these to be the best.

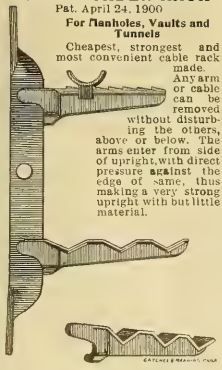
**WRITE FOR LIST OF PERSONS USING THESE RODS**

## THIS IS WHAT WE DO

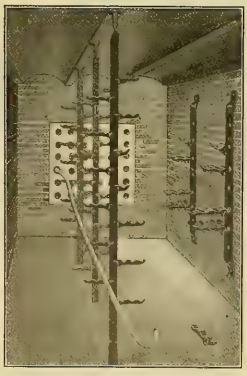
### PATENT CABLE RACK

Pat. April 24, 1900

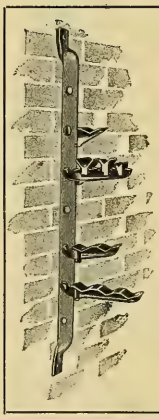
**For Manholes, Vaults and Tunnels**



Cheapest, strongest and most convenient cable rack made. Any arm or cable can be removed without disturbing the others, above or below. The arms enter from side of upright, with direct pressure against the edge of same, thus making a very strong upright with but little material.



Cable rack in vault or tunnel with arms on either side and cable entering from street. Wall rack on the side.



### CABLE RACK

**Wall Style**

Illustrating—No. 1 arm for 1 cable.
" No. 2 arm for 2 cables.
" No. 3 arm for 3 cables.
" No. 4 or ratchet arm for from 1 to 7 small cables.

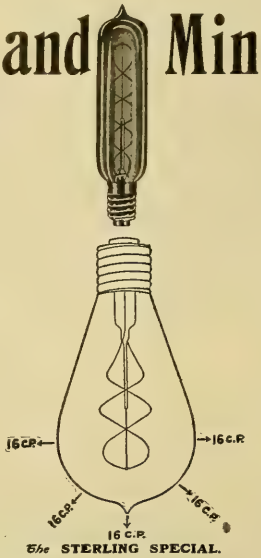
# Sterling Special and Miniature Lamps.

## Sterling Special

Gives full rated candlepower at all light-giving points of the bulb. The filament being mounted in double spiral form, the radiation of light is equal in all directions. Manufactured in all candlepowers and voltages. We guarantee that in ordering candlepower from us in our "STERLING SPECIAL" lamp the purchaser cannot find a light-giving point that will not give him exactly what he has ordered.



The STERLING SPECIAL.

| | | |
|---|---|---|
| Side | . . . | 16 Candlepower |
| Angle | . . . | 16 " |
| Tip | . . . | 16 " |
| Average | . . | 16 " |

## Sterling Miniature

We also manufacture a complete line of Miniature Battery and Candelabra Lamps for Signs and Decorative purposes, Show Windows, Show Cases, etc., ½ to 8 c. p.,—½ to 125 volts,—plain, frosted, dipped or natural colored bulbs.

Note:—These Miniature Lamps have the same spiral filament so successfully adopted in the "Sterling Special." Write for circular and prices.

Detroit, Chicago, St. Louis, Denver, San Francisco, Seattle.

## Preeminently the Storage Battery

It costs no more than the Cell Type.

It has comparatively, considerably more active material and occupies less space (about half that required by Cell Type).

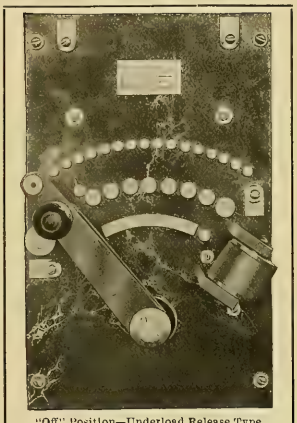
It is far more durable—is cleaner and more economical in operation and much less expensive in cost of maintenance.

Besides, this important fact must not be overlooked: There are no annoying and destructive fumes as with the Cell Type. The gas does not escape, therefore no corrosion of adjacent pipe or iron work or even the tarnishing of bright metal work.

**TRAY PLATE BATTERY CO.**

Successors Smith Storage Battery Co.

5-11 FREDERICK ST., BINGHAMTON, N. Y.



"Off" Position—Underload Release Type

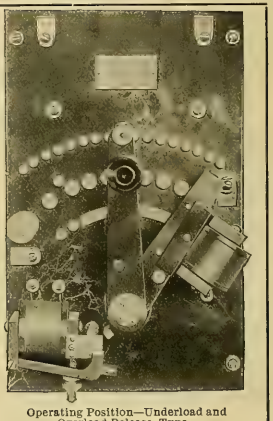
ANOTHER NEW

# C-H Controller

AND ANOTHER GOOD ONE

The controller herewith shown is intended for machine tools and similar apparatus.

*A SINGLE LEVER DOES BOTH STARTING AND REGULATING IN AN EASY AND SIMPLE MANNER*



Operating Position—Underload and Overload Release Type.

### How Simply it Operates

The motor is started and brought to speed by moving the handle to the right, this handle being attached to the field regulator lever which is mechanically connected to the starter lever so as to move them as one piece in starting the motor. During this operation of starting, the field resistance is short-circuited by an auxiliary contact mounted on the starter lever and a curved sector located just below the armature contacts. When the two levers have been moved to the position in which all resistance is cut out of the armature circuit, a keeper on the starter lever is attracted by the retaining magnet, and the starter lever is held in this position. At this time also the auxiliary contact above referred to has left the curved sector, thus removing the short-circuit from the field resistance. The field lever is now free for movement over the field rheostat buttons at the will of the operator, and may be left at any desired point, thus regulating the speed of the motor as desired. :: :: :: ::

It gives a wide range of speed through shunt field control.
The motor cannot be started on a weakened field.
Release magnets automatically return all parts to "off" position when required.
If you have not received bulletins describing it let us know.

**New Year--New Standard.**

We all at least have a fleeting thought of the next year being a better year. How to get it? Is it not by higher standards? Higher standards in anything give promise of better results.

"Flexduct" is the higher standard Flexible conduit. The new standards just adopted by those who know mean endurance, safety, less labor and surer results.

Where is this new standard more faithfully interpreted than in "Flexduct." No questions asked if you use "Flexduct", the known standard.

It Can't Be Beat—The Guthrie Flasher

A SIGN FLASHER WITHOUT A MOTOR

A FEW ADVANTAGES OF THIS FLASHER OVER ALL OTHERS:

*First.* The price is lower.

*Second.*—It has fewer parts and is therefore the simplest flasher on the market.

*Third.*—It has no motor to cause trouble and uses no current.

*Fourth.*—It costs nothing to operate this flasher.

*Fifth.*—It only occupies a space of 6x8 inches.

*Sixth.*—It can be regulated to flash any speed from a window washer to an automobile signal.

Any combination of lights without alteration of your wiring.

Simplest and best on the market.

Works on any current.

The disadvantage of a flasher was the motor question.

We have overcome this and are putting out an article that meets a long felt want.

A Bryan-Marsh lamp burned brightly 800 hours and then without a word of warning went out—died! It wasn't "sick" even an hour. It burned at maximum brightness during the entire 800 hours. Its "death" came about in a peculiar manner. It seemed to realize that after 800 hours of "high-speed" service it would then be compelled to "go slow"—or so to speak "burn dim." But rather than render an inefficient service it seemed to use a brain—it seemed to prefer to die—and die it did! Committed suicide to all intents and purposes.

This peculiarity in the Bryan-Marsh lamp, which might be called *"Automaticity in Extinguishment,"* is of great value to the user of incandescent lamps in large numbers. The loss in candlepower after a certain point has been reached in the life of an incandescent lamp is, comparatively speaking, tremendous; and a lamp that has, practically speaking, a "brain" or "thinking cap" that causes its self-sacrifice—its suicide at the particular point between economy and waste—preferring death to an indefinite siege of sickly "yellow fever"—such a lamp is the Bryan-Marsh lamp—*and isn't such a lamp worth buying, especially when you can get it at regular market prices?*

## Type B Motors

are the noiseless, sparkless, efficient kind. They deliver their full rated horsepower at slow speed, necessitating a solid, massive construction. They will stand up under the severest service, and are unequaled for general power purposes.

We make another type especially for elevator service, using with it our Automatic Controller. This combination cannot be excelled.

SWITCHBOARD INSTRUMENTS

The apparatus built by this Company received unusual recognition by the International Jury of the Louisiana Purchase Exposition, as above list of awards indicates. These awards were made after a comprehensive series of tests which enabled the performance of the apparatus to be gauged as well as its appearance and mechanical construction. By confining our attention to a limited line of products, we are able to maintain a high degree of perfection, this fact being amply evidenced by the constantly widenng sphere of our influence. We seek—

TO SUPPLY FIRST-CLASS APPARATUS
TO HAVE ITS PERFORMANCE ENTIRELY SATISFACTORY TO THE CUSTOMER AND TO EMPLOY METHODS OF DOING BUSINESS WHICH WILL MERIT THE CONFIDENCE OF OUR FRIENDS

Have you received our latest publication ?

## Wagner Electric Manufacturing Company

ST. LOUIS, U. S. A.

THIS "AD" appeared in the daily papers of Lincoln, Nebraska.

It refers to the AUTOMATIC TELEPHONE SERVICE of the Lincoln Telephone Company, who have been using our AUTOMATIC TELEPHONE SYSTEM since last March.

The "ad" contains within itself so many potent arguments in favor of AUTOMATIC TELEPHONE SERVICE that comment upon it is hardly necessary.

It shows, more plainly than anything else, that in Lincoln, as in every other city where our AUTOMATIC SYSTEM is in use, the people are quick to appreciate the superiority of AUTOMATIC TELEPHONE SERVICE and to vigorously support the company using it.

THE LINCOLN DAILY STAR, MONDAY EVENING, NOVEMBER 14, 1904

## ...NOTICE...

WE desire to notify our patrons and friends that we have discontinued the use of the Bell Telephone at our Wholesale Saddlery House, 808-814 P St., for the reason that we believe that the Bell service should be furnished at no higher price than the Automatic, and further, we find that most of our patrons have the Automatic service so that we found it unnecessary to have both. Our Automatic store number is 2324; J. C. Harpham residence 3546; C. F. Harpham residence 2404.

# THE TELEPHONE HAND-BOOK

**NEW AND REVISED EDITION, WITH A NEW CHAPTER ON "RECENT PROGRESS," BRINGING THE BOOK UP TO DATE.**

**BY HERBERT LAWS WEBB.**

*Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."*

**160 Pages, 133 Illustrations, Cloth, Hand-Book Size, Price $1.00.**

**Extract from Preface.**—"This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book on telephone working and management, and the TELEPHONE HAND-BOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice; and most of the material, apparatus and methods described are peculiar to or have originated in this country."

No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that anyone can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

**CONTENTS**

CHAPTER 1. The Invention of the Telephone.
2. Sound Waves. Articulate Speech.
3. Electric Telephony. The Bell Telephone.
4. The Microphone.
5. Current Induction. Electromagnetic Induction.
6. The Induction Coil: Its Use in the Telephone Transmitter.
7. The Complete Telephone Circuit.
8. Magnet Telephones.
9. The Bell Telephone Receiver.
10. Other forms of Magnet Telephones.
11. The Gower, Ader and D'Arsonval Receivers, Mercadier's Bi-Telephone.
12. The Siemens, Kotyra, Neumayer and Böttcher Receivers.
CHAPTER 13. Carbon Transmitters.
14. The Blake Transmitter.
15. The Long Distance Transmitter.
16. The Solid-back Transmitter.
17. The Berliner Transmitter.
18. The Cuttriss Transmitter.
19. Various European Transmitters.
20. The Efficiency of Carbon Transmitters.
21. Batteries for Telephone Work.
22. Open Circuit Batteries.
23. Closed Circuit Batteries.
24. The Practical Management of Batteries.
25. Magneto Bell.
26. Automatic Switches.
27. Telephone Line Construction.
CHAPTER 28. Metallic Circuit.
29. Underground Wires.
30. Lightning Arresters.
31. Inside Wiring.
32. Installation of Telephone Instruments.
33. Inspection and Maintenance.
34. The Condenser; Its Use in Telephony.
35. Electromagnetic Retardation.
36. Exchange Working.
37. Small Exchanges.
38. Party Lines: The Bridging Bell.
39. Long Distance Telephony.
40. Duplex Telephony.
41. Simultaneous Telegraphy and Telephony.
42. Recent Progress. Appendix.

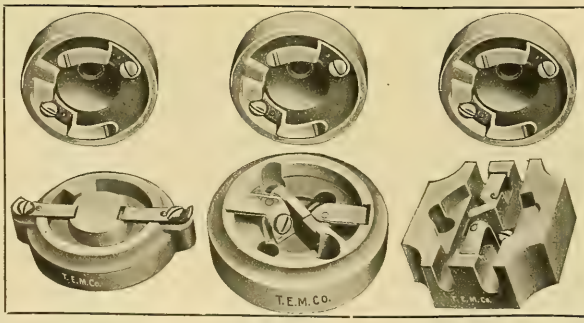
# TRUMBULL SPECIALTIES



**NEW FUSELESS ROSETTES**

Appreciated by al who have to do with wiring. May be fitted with cord and snapped on after the base is in position by merely a quarter turn of the wrist. Notice the stop in the cap. It can be put on only one way, so that in arc light work there is no possibility of reversing the current by taking off the rosette cap.

CAPS INTERCHANGEABLE. FIT EITHER STYLE OF BASE

Hole in cap takes new code cord. Sample sent prepaid.

**Write for our new 1905 Catalogue.**

"THE FOUR-TRACK SERIES"

This is the title of a series of books of travel and education issued by the Passenger Department of the

NEW YORK CENTRAL LINES

These small books are filled with information regarding the best modes of travel and the education that can best be obtained by travel.

They relate specifically to the great resorts of America — to trips to the islands of the sea and around the world.

They also contain numerous illustrations and new and accurate maps of the country described.

A copy of the 40-page illustrated Catalogue of the "Four Track Series" will be sent free postpaid, upon receipt of postage stamp by George H. Daniels, General Passenger Agt., New York Central & Hudson River Railroad, Grand Central Station, New York.

The Pennsylvania Lines

Represent All That Is Best

In Service and Equipment

# UNJUST BOYCOTT

The factory of HAMILTON CARHARTT, manufacturer of the Celebrated Carhartt Overall, is operated upon Union principles, absolutely and exclusively, and it is an outrageous injustice that he should be made to suffer, instead of being commended for the manly course he has pursued towards Organized Labor.—*Locomotive Firemen's Magazine, Indianapolis, Ind., July 1st.*

Common justice demands the statement that Hamilton Carhartt is conducting a Union establishment under Union conditions, placing the Union Label on his entire product, and sympathetically as well as practically demonstrating his friendship to the cause of Organized Labor.—*American Federationist, Samuel Gompers, Editor, Washington, D. C., July 1st.*

It would be the basest ingratitude for Union men not to show their appreciation of the manly stand you have taken regarding Organized Labor.—*Henry White, General Secretary United Garment Workers of America, New York City, June 25th.*

Your friendliness towards Organized Labor is too well known at home and abroad to be disputed, yet should any one doubt it, we will consider it a duty as well as a pleasure to place them right in the matter under the seal of this Council.—*Samuel A. Watrous, President Detroit Council Trade and Labor Unions, June 15th.*

Mr. Carhartt was the first manufacturer to advertise and push our Union Label, and Organized Labor owes him a debt of gratitude that they never can repay.—*Josephine E. Walsh, Secretary Local Union, No. 74, U. G. W. A., May 31st.*

I cannot condemn too strongly those who are seeking to besmirch the name of Hamilton Carhartt, manufacturer of the Celebrated Carhartt Overall. No man belonging to Organized Labor would be guilty of such a thing.—*H. W. Sherman, Grand Secretary International Brotherhood Electrical Workers, Washington, D. C., June 23d.*

While I firmly believe that there is no man worthy the name, or with an ounce of red blood in his veins, but what would resent the dastardly attempt to destroy my business by circulating malicious libels saying I am unfair to Organized Labor, still, that no one shall be misled, I present the above extracts from endorsements selected from the hundreds that have come to my desk. Yours Fraternally,

DETROIT, MICH.

SEPTEMBER 1st. 1904.

# The Electro-Magnet

—BY—

TOWNSEND WOLCOTT, A. E. KENNELLY, RICHARD VARLEY.

**PRICE, ONE DOLLAR,**

CONTENTS.

General Properties. Magnetic Field of Force. Magnetic Units. Induced Magnet, Reluctance, Permeability. Discovery of Electro-Magnetism. Iron Ring in the Magnetic Field. Calculation of Magnet Windings. Magnetic Circuit. Given Ampere-Turns to Find Proper Current. Relation of Ampere-Turns to Wire Space. Room Occupied by Insulation, Heating and Other Limiting Conditions. Winding a Magnet for a Given Voltage. Hysteresis, Self-Induction. Alternating Currents. Traction.

On the Relative Values of the Windings of Electro-Magnetic Coils. Properties of Fixed Winding Spaces and a Fixed Size of Wire. Properties of Fixed Winding Space and Variable Size of Wire. Fixed Winding Space and Fixed Length of Wire or Number of Turns. Constant Internal Dimensions, but External Diameter of Coil Variable. Fixed Internal Radius and Interflange-Fixed Number of Turns of Same Size of Wire.

The Importance of Details. Actual Calculations. Working Formulæ. Diameter of Wire to Carry Given Current. Diameter of Wire to Have Given Resistance. Thickness of Insulation in a Given Coil. Weight of Copper in a Given Coil. Table of Constants for Insulated Wire. Standard Table of Resistances of Insulated Wires. Table Showing Percentage of Copper and Insulation in Cotton or Silk Covered Wire. Standard Copper Wire Table. 17 Problems (Solved) Illustrated. Cuts of 37 Magnets of Standard Dimensions, Lengths Variable. Logarithms and Anti-Logarithms. Decimal Parts of an Inch. Logarithmic Scale.

# SAMSON TURBINE

The illustration shows the large NIAGARA design, HORIZONTAL SHAFT TURBINES recently installed by us, for the NIAGARA FALLS HYDRAULIC POWER & MANUFACTURING CO., Niagara Falls, N. Y. Tests conducted by competent engineers, developed as follows:

| Head | Gateage | Speed | H. P. | Generator Efficiency | Turbine Efficiency |
|---|---|---|---|---|---|
| 213 ft. | ½ | 257 r. p. m. | 1750 | 95 per cent. | 73.00 per cent. |
| 213 ft. | ¾ | 257 r. p. m. | 3000 | 95 per cent. | 85.60 per cent. |
| 213 ft. | Full | 257 r. p. m. | 3500 | 95 per cent. | 81.50 per cent. |

These results have never been equaled by any turbine of the Horizontal Shaft Design, operating under equally HIGH HEADS. The test was made AFTER TURBINES WERE INSTALLED, direct coupled to generators. Francis' weirs and formulæ for discharge were used. The original test reports on file at our offices. These turbines are all fitted with our SAMSON BALANCED GATES. Note especially the UNIFORM SPEED at ALL GATEAGES.

Full of information and diagrams for the operator, exchange owner, exchange manager, inspector, trouble man, lineman.

A complete description of telephones and their troubles. How to find and remedy them, together with working plans for exchange construction, complete with diagrams of all up-to-date telephones and switchboards.

This is a practical book, written in **plain language,** and for **anyone** interested in telephony.

Mailed anywhere on receipt of price . . . ONE DOLLAR.

No technicalities. Substantially bound in cloth.

ELECTRICIAN PUBLISHING CO.,
510 MARQUETTE BUILDING, CHICAGO.

Keys for the Practical Electrical Worker
*By F. J. ROBINSON.*

Electric Light, Power, Street Railway, Telephone, Telegraph and the every-day tables explained almost entirely by drawings and diagrams of connections taken from the very latest practice.

Nearly 200 pages. Price $2.00.

Prepaid to any address in the world.

ELECTRICIAN PUBLISHING CO.
PUBLISHERS OF AND DEALERS IN SCIENTIFIC BOOKS
510 MARQUETTE BUILDING, - - - CHICAGO.

A PRACTICAL BOOK
FOR PRACTICAL MEN
"MODERN WIRING DIAGRAMS AND DESCRIPTIONS FOR ELECTRICAL WORKERS."

By Henry C. Horstmann and Victor H. Tousley. 160 pages, over 200 illustrations. Full leather binding, red edges. Pocket size 4 x 6. Price, net, $1.50.

A work that not only tells you how to do it, but shows you.

THIS BOOK tells how to wire for call and alarm bells. For burglar and fire alarm. How to run bells from dynamo current. How to install and manage batteries. How to test batteries. How to test circuits. How to wire for enunciators; for telegraph and gas lighting. It tells how to locate "trouble" and "ring out" circuits. It tells about meters and transformers It contains 30 diagrams of electric lighting circuits alone. It explains dynamos and motors, alternating and direct current. It gives 10 diagrams of ground detectors alone. It gives "Compensator" and Storage Battery installation. It gives simple and explicit explanations of the "Wheatstone Bridge" and its uses as well as volt meter and other testing. It gives a new and simple wiring table, covering all voltages and all losses or distances, etc., etc.

# SUBSCRIPTIONS.

With January 1st began the thirty-sixth volume of the WESTERN ELECTRICIAN, and during 1905 it will complete its eighteenth and the first half of its nineteenth year, the paper having been founded July 2, 1887, and continued under the present management for this entire period. We offer the past as a guaranty of the future, and in addition pledge the best efforts of an experienced and competent staff to the constant improvement of the paper.

The WESTERN ELECTRICIAN is published for the purpose of assisting everyone interested in the art. It is a general electrical and scientific paper, and gives to its readers all the latest news and keeps them thoroughly informed of everything that is going on in all the different departments of the electrical and allied fields. Its technical and scientific articles cover all the latest inventions and improvements and keep the reader thoroughly informed of all that is new in the art. Its special articles, written by the most prominent authorities, as well as its general articles, are of the highest order, and no interested person can afford to be without the paper.

Car on Interworks Railway Equipped with Four 75 H. P. Westinghouse Single-Phase Railway Motors. Photograph taken with a time exposure of 1-300 of a second, while car was traveling 40 miles per hour.

# The Westinghouse Single-Phase Railway System

## Is no experiment, but an accomplished fact

**Ten roads are now in course of construction, the cars being equipped with a total of 218 motors, representing 15,435 H. P.**

**The system has many advantages; two of them are:**

1. High trolley voltages are allowable. This means saving in copper and power.
2. The transforming points contain no machinery with moving parts, rendering constant attendance unnecessary.

**For particulars address nearest office of**

## Westinghouse Electric & Mfg. Co.

THE

**Standard Motor Starter of the World**

Copied by almost every starter maker. Prompt prosecutions of infringements and the upholding of our patents by the courts prevented its duplication.

The strongest proof that it is as we claim, "the least expensive motor starter safe to use on any installation," is found in the attempts to build as much like it as possible without infringing.

**THE CUTLER HAMMER MFG. CO.**

NEW YORK BOSTON MILWAUKEE, WIS. CHICAGO PITTSBURG

# THE PITTSBURGH PIPE THAWER

It looks as if we had hit upon a brand new, long-felt want. Every Central [illegible] located where winters are of the old-fashioned kind needs a pipe thawer. There is no question about the practicability of the method and it pays. Last winter [illegible] companies tried it and the revenue derived ran from several hundred dollars up to ten thousand for the season.

This Trade-Mark guarantees quality.

The Hart Mfg. Co., Hartford, Conn.

New York Boston Chicago Toronto, Ont.

---

## "FLEXDUCT"

is a trade name for a flexible non-metallic conduit that is approved by all official inspection boards.

"Flexduct" is a tough fibrous tubing, being flexible, strong and enduring. It is a moisture repellant. "Flexduct" has a smooth, even interior, unaffected by swashing, crushing or sharp bends. It is indestructible. Greater lengths can be fished, time saved in construction and a higher class job is possible with "Flexduct."

## Osburn Flexible Conduit Company,

New York Chicago San Francisco

## "FLEXDUCT"

is for sale by all electrical jobbers. If local dealer cannot furnish, write us and we will arrange for prompt shipment. Specify "Flexduct."

---

Our Compound Stops Sparking and Saves Commutators.

14 Years' Use on Street Ry., Light and Power Commutators Has Proven its Worth. WE GUARANTEE RESULTS.

## A PRACTICAL BOOK
### FOR PRACTICAL MEN
### "MODERN WIRING DIAGRAMS AND DESCRIPTIONS FOR ELECTRICAL WORKERS."

By Henry C. Horstmann and Victor H. Tousley. 160 pages, over 200 illustrations. Full leather binding, rod edges. Pocket size 4 x 6. Price, net, $1.50.

**A work that not only tells you how to do it, but shows you.**

THIS BOOK tells how to wire for call and alarm bells. For burglar and fire alarm. How to run bells from dynamo current. How to install and manage batteries. How to test batteries. How to test circuits. How to wire for enunciators; for telegraph and gas lighting. It tells how to locate "trouble" and "ring out" circuits. It tells about meters and transformers. It contains 30 diagrams of electric lighting circuits alone. It explains dynamos and motors; alternating and direct current. It gives 10 diagrams of ground detectors alone. It gives "Compensator" and Storage Battery installation. It gives simple and explicit explanations of the "Wheatstone Bridge" and its uses as well as volt meter and other testing. It gives a new and simple wiring table, covering all voltages and all losses or distances, etc., etc.

**"THE FOUR-TRACK SERIES"**

This is the title of a series of books of travel and education issued by the Passenger Department of the

**NEW YORK CENTRAL LINES**

These small books are filled with information regarding the best modes of travel and the education that can best be obtained by travel.

They relate specifically to the great resorts of America — to trips to the islands of the sea and around the world.

They also contain numerous illustrations and new and accurate maps of the country described.

A copy of the 40-page illustrated Catalogue of the "Four Track Series" will be sent free, postpaid, upon receipt of postage stamp by George H. Daniels, General Passenger Agt., New York Central & Hudson River Railroad, Grand Central Station, New York.

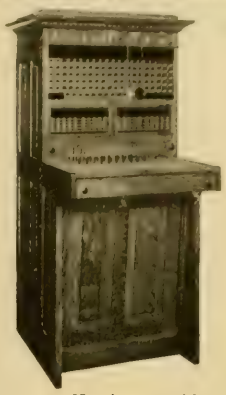
**STROMBERG-CARLSON**

***GENERATOR-CALL***

**VISUAL SIGNAL SWITCHBOARDS**

are inexpensive to maintain and nearly as rapid as a lamp signal switchboard

***SIGNALS SELF-CONTAINED***



***NO WORKING PARTS EXPOSED***

This illustrates our No. A-1249 cabinet equipped with 100 line signals and 10 clearing-out signals. Our standard cabinets have a capacity for 50, 60, 70, 100, 140, 180 and 200 line signals of the above type.

***Bulletins No. 6 and 7-E describe these boards very thoroughly. Mailed free upon request.***

**GENERAL OFFICES, ROCHESTER, N. Y.**

**WESTERN SALES OFFICE, CHICAGO, ILL.**

**Warren Alternator**

It's not the OLD-FASHIONED kind that revolves a bundle of copper wire and a mysterious set of copper rings one or two thousand revolutions a minute—takes brushes and intricate apparatus to collect the current and get it out on the circuit wires.

**We Guarantee What We Sell and Sell What We Guarantee.**

WARREN ELECTRIC MFG. CO.

Sandusky, O.

THIS "AD" appeared in the daily papers of Lincoln, Nebraska.

It refers to the AUTOMATIC TELEPHONE SERVICE of the Lincoln Telephone Company, who have been using our AUTOMATIC TELEPHONE SYSTEM since last March.

The "ad" contains within itself so many potent arguments in favor of AUTOMATIC TELEPHONE SERVICE that comment upon it is hardly necessary.

It shows, more plainly than anything else, that in Lincoln, as in every other city where our AUTOMATIC SYSTEM is in use, the people are quick to appreciate the superiority of AUTOMATIC TELEPHONE SERVICE and to vigorously support the company using it.

THE LINCOLN DAILY STAR. MONDAY EVENING, NOVEMBER 14, 1904.

**...NOTICE...**

WE desire to notify our patrons and friends that we have discontinued the use of the Bell Telephone at our Wholesale Saddlery House, 808-814 P St., for the reason that we believe that the Bell service should be furnished at no higher price than the Automatic, and further, we find that most of our patrons have the Automatic service so that we found it unnecessary to have both. Our Automatic store number is 2324; J. C. Harpham residence 3546; C. F. Harpham residence 2404.

# SUBSCRIPTIONS.

With January 1st began the thirty-sixth volume of the WESTERN ELECTRICIAN, and during 1905 it will complete its eighteenth and the first half of its nineteenth year, the paper having been founded July 2, 1887, and continued under the present management for this entire period. We offer the past as a guaranty of the future, and in addition pledge the best efforts of an experienced and competent staff to the constant improvement of the paper.

The WESTERN ELECTRICIAN is published for the purpose of assisting everyone interested in the art. It is a general electrical and scientific paper, and gives to its readers all the latest news and keeps them thoroughly informed of everything that is going on in all the different departments of the electrical and allied fields. Its technical and scientific articles cover all the latest inventions and improvements and keep the reader thoroughly informed of all that is new in the art. Its special articles, written by the most prominent authorities, as well as its general articles, are of the highest order, and no interested person can afford to be without the paper.

# Allis-Chalmers Co
MILWAUKEE WIS U S A

## Competitors Scoffed

**When** the greatest Engine Building and Mining Machinery makers in the country entered the Electrical Field

**After** that there were rumors of buying up, "amalgamating," and the rest of it,—rumors without a fraction of foundation in fact.

**Then,** when we won, at St. Louis Exposition, Electrical, Engine, and Mining Machinery Grand Prizes, and other high awards, the country took thought, for

**Now** these facts are clear: there is

## Real Competition at Last

in the Electrical Industry

The market can no longer be controlled by one or two companies

## This Company is equipped to Build

THE LARGEST GENERATORS
THE MOST POWERFUL MOTORS
THE LARGEST POWER UNITS

We have the Works—The Machinery—The Men
We have offices in most large cities—Six large works
Our Electrical Headquarters are at Cincinnati

ELECTRICAL DEPARTMENT
# The Bullock Electric Mfg Co
CINCINNATI OHIO

Canadian representatives Allis-Chalmers-Bullock, Ltd., Montreal.

# THE ELECTRIC STORAGE BATTERY CO.

PHILADELPHIA

MANUFACTURER OF THE

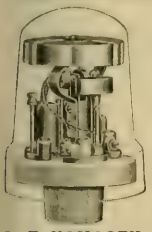
## "Chloride Accumulator"

For Central Stations, Electric Railways, Isolated Lighting and Power Stations, Fire Alarm, Telegraph, Train Lighting, etc., etc.

PRICE LISTS AND DESCRIPTIVE BULLETINS FORWARDED UPON REQUEST.

SALES OFFICES:

PHILADELPHIA, Allegheny Ave. and 19th St. | NEW YORK, 100 Broadway, | BOSTON, 60 State St. | CHICAGO Marquette Bldg. | ST. LOUIS, Wainwright Bldg. | SAN FRANCISCO, Rialto Bldg. | CLEVELAND, Citizens Bldg. | CANADA Canadian General Electric Co., Ltd., Toronto | HAVANA [illegible]



# 100

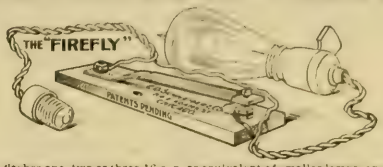
Arc lights kept burning by closing one open circuit on one broken lamp loop.

THIS AUTOMATIC Series Arc CUT-OUT

Will do so. Call for sample.

**A. F. HAMACEK, Chicago, Ill.**

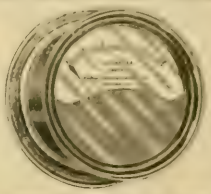
## A MOTORLESS FLASHER



Automatically flashes one, two or three 16 c. p. or equivalent of smaller lamps, on either direct or alternating current. Contacts are heavy platinum and will wear indefinitely. Requires no attention and has nothing to get out of order. PRICE $2.00 EACH. Write for discount to the trade.

**C. O. Schneider & Co., Mfrs. 84 E. Adams St., Chicago**

## AN INSTRUMENT FOR ISOLATED PLANT WORK.



Diameter of Base Flange, 7 Inches.

LIST PRICE $16.50.

This popular type of Ammeter [illegible] instrument has a [illegible] dial [illegible] giving [illegible] readings [illegible] and indicating [illegible] capacity are [illegible] standard.

CHICAGO NEW YORK

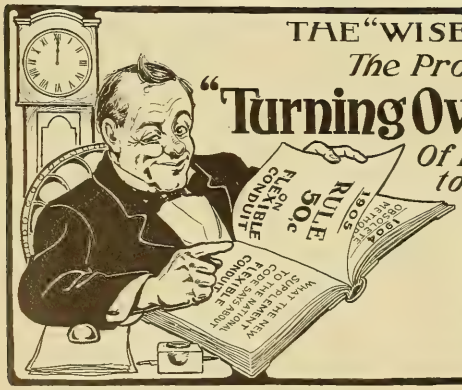
And Other Large Cities

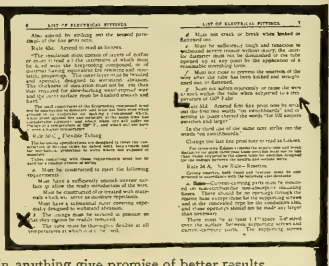
THE "WISE ONE" IS ON

*The Proverbial*

**"Turning Over a New Leaf"**

*Of Particular Significance to the Wise Buyer*





**New Year--New Standard.**

We all at least have a fleeting thought of the next year being a better year. How to get it? Is it not by higher standards? Higher standards in anything give promise of better results.

"Flexduct" is the higher standard Flexible conduit. The new standards just adopted by those who know mean endurance, safety, less labor and surer results.

Where is this new standard more faithfully interpreted than in "Flexduct." No questions asked if you use "Flexduct", the known standard.

**OSBURN FLEXIBLE CONDUIT CO.,** New York, Chicago, San Francisco.

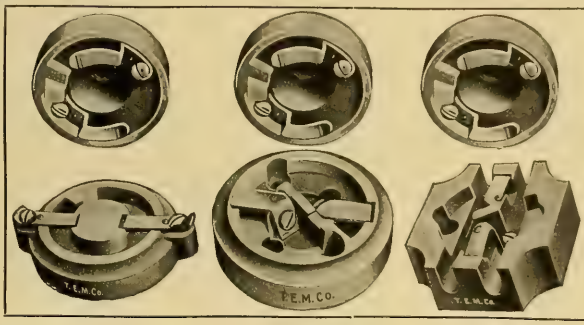
# TRUMBULL SPECIALTIES



**NEW FUSELESS ROSETTES**

Appreciated by all who have to do with wiring. May be fitted with cord and snapped on after the base is in position by merely a quarter turn of the wrist. Notice the stop in the cap. It can be put on only one way, so that in arc light work there is no possibility of reversing the current by taking off the rosette cap.

CAPS INTERCHANGEABLE. FIT EITHER STYLE OF BASE

Hole in cap takes new code cord. Sample sent prepaid.

*Some Changes in the*

## C.-H. "CARPENTER" CONTROLLER

FOR SMALL MOTORS

We've made some mechanical changes in the C.-H. "Carpenter" type of controller for motors from ¼ to 3 H. P. which have resulted in making it more compact.

For operating printing presses and machine tools this controller has been a great success, many of the largest printing establishments in the country employing it exclusively. Bulletins 88 to 89½ describe the new type for small motors.

THE CUTLER-HAMMER MFG. CO., MILWAUKEE, WIS.

NEW YORK BOSTON CHICAGO PITTSBURG

# LIGHTING THE NEW TIMES BUILDING

is not the least of this 476-foot sky-scraper's wonders. Lighting the huge presses, 55 feet below ground, was a serious problem solved by using

## Cooper Hewitt Mercury Vapor Lamps

In the press and stereotype rooms, 26 Cooper Hewitt lamps take the place of 132 incandescent lamps with separate outlets and 14 arc lamps, besides saving two-thirds of the current and obviating the need of drilling 1,600 holes for incandescent lamps in the press frames.

They light thoroughly all the machines and 17,000 square feet of floor space with a ceiling 21 feet high.

The composing room is lighted by 12 Cooper Hewitt lamps. Those who have worked under these for six months consider the light the nearest approach to daylight yet developed. The light is soft and cool to the eyes. Casting no shadows, it makes type legible in any position. Eliminating reflections from bright surfaces, it renders new type easy to read.

In the mailing room, there are 4 Cooper Hewitt lamps, making 42 in all—two in series of 118 volts direct current, each consuming 3.5 amperes.

**PAUL LETHEULE, 4808 Delmar Bd., St. Louis**

**Preeminently the Storage Battery**

It costs no more than the Cell Type.
It has comparatively, considerably more active material and occupies less space (about half that required by Cell Type).
It is far more durable—is cleaner and more economical in operation and much less expensive in cost of maintenance.
Besides, this important fact must not be overlooked: There are no annoying and destructive fumes as with the Cell Type. The gas does not escape, therefore no corrosion of adjacent pipe or iron work or even the tarnishing of bright metal work.

# THE TELEPHONE HAND-BOOK

**NEW AND REVISED EDITION, WITH A NEW CHAPTER ON "RECENT PROGRESS," BRINGING THE BOOK UP TO DATE.**

**BY HERBERT LAWS WEBB.**

*Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."*

**160 Pages, 133 Illustrations, Cloth, Hand-Book Size, Price $1.00.**

**Extract from Preface.**—"This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book on telephone working and management, and the TELEPHONE HAND-BOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice; and most of the material, apparatus and methods described are peculiar to or have originated in this country."

No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that anyone can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

CONTENTS

CHAPTER 1. The Invention of the Telephone.
2. Sound Waves. Articulate Speech.
3. Electric Telephony. The Bell Telephone.
4. The Microphone.
5. Current Induction. Electromagnetic Induction.
6. The Induction Coil: Its Use in the Telephone Transmitter.
7. The Complete Telephone Circuit.
8. Magnet Telephones.
9. The Bell Telephone Receiver.
10. Other forms of Magnet Telephones.
11. The Gower, Ader and D'Arsonval Receivers, Mercadier's Bi-Telephone.
12. The Siemens, Kotyra, Neumayer and Böttcher Receivers.
CHAPTER 13. Carbon Transmitters.
14. The Blake Transmitter.
15. The Long Distance Transmitter.
16. The Solid-back Transmitter.
17. The Berliner Transmitter.
18. The Cuttriss Transmitter.
19. Various European Transmitters.
20. The Efficiency of Carbon Transmitters.
21. Batteries for Telephone Work.
22. Open Circuit Batteries.
23. Closed Circuit Batteries.
24. The Practical Management of Batteries.
25. Magneto Bell.
26. Automatic Switches.
27. Telephone Line Construction.
CHAPTER 28. Metallic Circuit.
29. Underground Wires
30. Lightning Arresters.
31. Inside Wiring.
32. Installation of Telephone Instruments.
33. Inspection and Maintenance.
34. The Condenser; Its Use in Telephony.
35. Electromagnetic Retardation.
36. Exchange Working.
37. Small Exchanges.
38. Party Lines; The Bridging Bell.
39. Long Distance Telephony.
40. Duplex Telephony.
41. Simultaneous Telegraphy and Telephony.
42. Recent Progress. Appendix.

# A PRACTICAL BOOK

## FOR PRACTICAL MEN

## "MODERN WIRING DIAGRAMS AND DESCRIPTIONS FOR ELECTRICAL WORKERS."

By Henry C. Horstmann and Victor H. Tousley. 160 pages, over 200 illustrations. Full leather binding, red edges. Pocket size 4 x 6. Price, net, $1 50.

**A work that not only tells you how to do it, but shows you.**

THIS BOOK tells how to wire for call and alarm bells. For burglar and fire alarm. How to run bells from dynamo current. How to install and manage batteries. How to test batteries. How to test circuits. How to wire for annunciators; for telegraph and gas lighting. It tells how to locate "trouble" and "ring out" circuits. It tells about meters and transformers. It contains 30 diagrams of electric lighting circuits alone. It explains dynamos and motors; alternating and direct current. It gives 10 diagrams of ground detectors alone. It gives "Compensator" and Storage Battery installation. It gives simple and explicit explanations of the "Wheatstone Bridge" and its uses as well as volt meter and other testing. It gives a new and simple wiring table, covering all voltages and all losses or distances, etc., etc.

# TELEPHONE PRINCIPLES AND PRACTICE

## A NEW BOOK IN TELEPHONY

By

**GEORGE WALKER WILDER, PH. D.**

Professor in Telephony in the Armour Institute of Technology

Complete and up-to-date, written by a practical man. All about modern telephone apparatus, their principles and use:

I. Fundamental Ideas
II. Telephone Apparatus
III. Systems of Communication
IV. Construction and Equipment

IN 32 CHAPTERS, 450 PAGES, 375 ILLUSTRATIONS. PRICE $2.00 POSTPAID.

Send Postal Money Order to

**THE CANTWELL PRESS - Madison, Wis.**

# THE AUTOMATIC

is the recognized competitive system of telephony. Its manifold advantages over the manual system, mechanically, financially and commercially, make it so. Automatic telephone service is more prompt and more accurate and absolutely secret. It can be furnished at less cost to both company and patrons than any other. Progressive Independent telephone companies all over the country are rapidly adopting it; the new ones in preference to manual and the old ones to replace manual equipment. It is a success everywhere.

Among the cities in which it has been adopted are:

Chicago, Ill.
Grand Rapids, Mich.
Columbus, Ohio
Dayton, Ohio
Lincoln, Neb.
Portland, Maine
Auburn, N. Y.
Lewiston, Maine
Auburn, Maine
Fall River, Mass.
New Bedford, Mass.
Los Angeles, Cal.
San Diego, Cal.
Hopkinsville, Ky.
Sioux City, Iowa
Cleburne, Texas
Columbus, Ga.
Augusta, Ga.
Medford, Wis.
St. Mary's, Ohio
Woodstock, N. B.
Westerly, R. I.
Berlin, Germany
Manchester, Iowa
Princeton, N. J.
Albuquerque, N. M.
Van Wert, Ohio
Battle Creek, Mich.
Clayton, Mo.
Pentwater, Mich.
Toronto Junction, Can.
Wilmington, Del.
Riverside, Cal.
Traverse City, Mich.

## C.-H. "CARPENTER" CONTROLLER

FOR SMALL MOTORS

We've made some mechanical changes in the C-H "Carpenter" type of controller for motors from ½ to 3 H. P. which have resulted in making it more compact.

For operating printing presses and machine tools this controller has been a great success, many of the largest printing establishments in the country employing it exclusively. Bulletins 88 to 89½ describe the new type for small motors.

# "SAMSON SPOT CORD"

***If used for hanging Arc Lamps, saves heads, lamps and expensive renewals; BECAUSE:***

FIRST—The stitches double on each other, giving freedom of play and distributing the strain equally over all the strands.

SECOND—It is made of extra quality stock, warranted free from waste.

THIRD—Being warranted free from bad splices and rough braiding, the smooth surface causes minimum abrasion and maximum wear.

For the same reasons this cord is much the most durable for Trolley Cord and Bell Cord.

We gladly send tests and samples, with full information, to all interested.

# LIGHTING THE NEW TIMES BUILDING

is not the least of this 476-foot sky-scraper's wonders. Lighting the huge presses, 55 feet below ground, was a serious problem solved by using

## Cooper Hewitt Mercury Vapor Lamps

In the press and stereotype rooms, 26 Cooper Hewitt lamps take the place of 132 incandescent lamps with separate outlets and 14 arc lamps, besides saving two-thirds of the current and obviating the need of drilling 1,600 holes for incandescent lamps in the press frames.

They light thoroughly all the machines and 17,000 square feet of floor space with a ceiling 21 feet high.

The composing room is lighted by 12 Cooper Hewitt lamps. Those who have worked under these for six months consider the light the nearest approach to daylight yet developed. The light is soft and cool to the eyes. Casting no shadows, it makes type legible in any position. Eliminating reflections from bright surfaces, it renders new type easy to read.

In the mailing room, there are 4 Cooper Hewitt lamps, making 42 in all—two in series of 118 volts direct current, each consuming 3.5 amperes.

Gold Medal **Single-Phase A. C. Motors**
Gold Medal **Static Transformers**
Silver Medal **Switchboard Instruments**

THE apparatus built by this Company received unusual recognition by the International Jury of the Louisiana Purchase Exposition, as above list of awards indicates. These awards were made after a comprehensive series of tests which enabled the performance of the apparatus to be gauged as well as its appearance and mechanical construction. By confining our attention to a limited line of products, we are able to mantain a high degree of perfection, this fact being amply evidenced by the constantly widening sphere of our influence. We seek

**To supply first-class apparatus. To have its performance entirely satisfactory to the customer. And to employ methods of doing business which will merit the confidence of our friends.**

**New Year--New Standard.**

We all at least have a fleeting thought of the next year being a better year. How to get it? Is it not by higher standards? Higher standards in anything give promise of better results.

"Flexduct" is the higher standard Flexible conduit. The new standards just adopted by those who know mean endurance, safety, less labor and surer results.

Where is this new standard more faithfully interpreted than in "Flexduct." No questions asked if you use "Flexduct", the known standard.

## NOTICE OF SUITS.

We beg to inform the trade that we have started legal proceedings against the following concerns manufacturing and selling Prismatic Hoods and Reflectors which we claim infringe our patents: The Gilbert Prism Hood Company of New York City, the Prismatic Hood Company of New York City, and the Illuminating Engineering Company of New York City. Suits in course of preparation will soon be started against other infringing concerns.

We control fundamental mechanical patents as well as design patents, which thoroughly protect all prismatic hoods or prism glass reflectors sold by us under the trade names "PAGODA" and "HOLOPHANE."

We also wish to announce the consolidation of our New York and Chicago Offices, in the Glackner Building, 227-229 Fulton street, corner of West Broadway, New York City, where all orders and correspondence should be sent.

**HOLOPHANE GLASS CO.**

# Keep Up With the Procession.

**Everyone engaged in the electrical business should keep posted on the developments in the art by reading the latest books on the subject. We are headquarters in the West for electrical books and can fill orders for any work published, promptly on receipt of price. We call your special attention to the following standard books:**

ALLSOP, F. C.—Electrical Bell Construction; Treatise on the Construction of Electric Bells, Indicators and similar apparatus. 177 illustrations .....$1.25

ATKINSON, PHILIP.—The Elements of Electric Lighting. Seventh edition, fully revised, and new matter added. 104 illustrations. 260 pages.....$1.50

ATKINSON, PHILIP.—The elements of Dynamic Electricity and Magnetism. 405 pages and 117 illustrations. Second edition .....$2.00

AYRTON, W. E.—Practical Electricity; a Laboratory and Lecture Course for First-year Students of Electrical Engineering. Based on the Practical Definitions of the Electrical Units. With numerous illustrations. Sixth edition .....$2.50

BADT, LIEUT F. B.—New Dynamo Tenders' Hand Book. This is, as the name indicates, a NEW BOOK, much more complete than the old one, with all the information, instructions and rules which are required by practical men, as Dynamo Tenders, Linemen, Stationary Engineers and owners and operators of all kinds of Electric Plants. It is the only book of the kind published in the English language. 226 pages, 140 illustrations, flexible cloth binding, size of type page 5½x3 inches .....$1.00

BADT, LIEUT. F. B.—Incandescent Wiring Hand Book. A timely book containing full illustrations for incandescent wiring and complete information concerning methods of running wires, location of safety devices, splices, insulation, testing for faults, wire gauges, general electrical data, calculating sizes of wires, wiring fixtures, elevators, buildings, isolated and central station plants. The only book of the kind published. Type page 5½x3 inches, flexible cloth binding, 66 pages, 38 cuts and 5 tables, 3 of which are 12x18 inches .....$1.00

BADT, LIEUT. F. B.—Bell Hangers' Hand Book. Just the book for people engaged in selling, installing or handling electric batteries, electric bells, elevators, house or hotel annunciators, burglar or fire alarms, electric gas lighting apparatus, electric heat apparatus. 108 pages, 97 illustrations, flexible cloth binding. Type page 5½x3 inches .....$1.00

BADT, LIEUT. F. B.—Electric Transmission Hand Book. First edition, 3,000 copies. 97 pages, 22 illustrations. 27 original tables .....$1.00
Gives more practical information on the subject than any work published to date. The book contains all necessary information for Power Producers, Capitalists, Agents, Engineers and Motor Inspectors. With this book anybody may make estimates on the cost of Transmission Plants.

BEDELL, FRED'K AND ALBERT C. CREHORE.—Alternating Currents; an Analytical and Graphical Treatment for Students and Engineers. Second edition. 112 illustrations .....$2.50

BELL, LOUIS, PH. D.—The Art of Illumination. This is the only book in the language which deals directly with the scientific and artistic use of modern illuminants, electric and other. Cloth, 339 pages, 127 illustrations. Price .....$2.50

BONNEY, G. E.—Electro-Plater's Hand Book. Manual for Amateurs and Young Students on Electro-Metallurgy. 60 illustrations, 208 pages. 12mo. cloth....$1.25

BOTTONE, S. R.—Electrical Instrument Making for Amateurs. A Practical Hand Book, with 48 illustrations. Fourth edition. Enlarged by a chapter on the Telephone .....$0.50

BOTTONE, S. R.—The Dynamo, How Made and How Used. A Book for Amateurs. Eighth edition. New additional matter and 39 illustrations.....$1.00

BOTTONE, S. R.—Electro-Motors. How Made and How Used. A Hand Book for Amateurs and Practical Men. Reduced to .....$0.50

BUCKLEY, W. J.—Electric Lighting Plants, Their Cost and Operation. 275 pages, many illustrations and diagrams. Paper .....$1.00

CROCKER, F. B. AND WHEELER, S. S.—The Practical Management of Dynamos and Motors. With a special chapter by H. A. Foster. Illustrated. Second edition, revised and enlarged.....$1.00

CUSHING, H. C., JR.—Standard Wiring for Electric Light and Power. A compilation of formulæ, rules and requirements from the most modern practice, and in accordance with the rules and requirements of the Boston Fire Underwriters, the New York Board of Insurance Exchange, and as recommended by the Underwriters' International Electric Association. 12mo. leather .....$1.00

DESMOND, CHAS.—Electricity for Engineers. Part I. Constant Current. A clear and comprehensive treatise on the principles, construction and operation of Dynamos, Motors, Lamps, Indicator and Measuring Instruments; also full explanation of the electrical terms used in the work. Part II. Alternate Current Apparatus. Containing an explanation of the principles governing the generation of, and a description of the instruments and machinery used in connection with, Alternate Electric Currents. Illustrated. Revised edition .....$2.50

DOBBS, A. E.—The Inspector and Trouble Man. A practical book, written in plain language. Full of information and diagrams for the operator, exchange manager, inspector, trouble man and lineman. A complete description of telephones, how to find and remedy their troubles, together with working plans for exchange construction, complete with diagrams of all up-to-date telephones and switchboards. 106 pages. Price....$1.00

DYER, A.—Induction Coils, How Made and How Used. Third edition. Boards .....$0.50

FLEMING, J. A.—Short Lectures to Electrical Artisans. A course of Experimental Lectures delivered to a Practical Audience. Fourth edition. 74 illustrations..$1.50

FLEMING, J. A.—The Alternate Current Transformer in Theory and Practice. Vol. I. The Induction of Electric Currents. 500 pages, fully illustrated and with copious index. Second edition .....$3.00
Synopsis of contents: Chapter 1. Introductory. 2. Electro-Magnetic Induction. 3. The Theory of Simple Periodic Currents. 4. Mutual and Self Induction. 5. Dynamical Theory of Current Induction.
Vol. II. The Utilization of Induced Currents. 8vo. cloth. London, 1892 .....$5.00

GAYETTY, J. W.—Motorman's Guide. A Practical Treatise on Street Railway Motors. Illustrations and diagrams. Cloth .....$0.50

GORDON.—School Electricity. Sources, Currents, Measurement, Telegraphy, Telephony, Lightning, Electrolysis, Induction, etc. 262 pages, with 140 illustrations..$2.00

GORE, G.—The Art of Electro-Metallurgy, including all Known Processes of Electro Deposition. Fourth edition .....$2.00

GRIER, THOS. G.—Wiring for Motor Circuits. A handy little pamphlet containing tables for wiring and for motor service, arranged in convenient form for ready reference .....$1.00

HASKINS, C. C.—Electricity Made Simple. 233 pages, 108 illustrations. Paper covers .....$0.50
A valuable, non-technical work for those whose opportunities for gaining information on the branches treated have been limited.

HASKINS, C. H.—The Galvanometer and its Uses. A Manual for Electricians and Students. Fourth edition; revised .....$1.50

HASKINS.—Transformers. Their Theory, Construction and Application Simplified. 38 illustrations.....$1.25

HAWKINS, C. C. AND F. WALLIS.—The Dynamo, Its Theory, Design and Manufacture. 190 illustrations.$3.00

HAWKINS, N.—New Catechism of Electricity. A Practical Treatise Relating to the Dynamo and Motor, Wiring, the Electric Railway, Bell Fitting, etc., etc. Red leather, pocketbook form. 95 illustrations....$2.00

HOMANS, J. E., A. M.—A, B, C OF THE TELEPHONE. 352 pages, 269 illustrations. Price.....$1.00
Owing to the demand for a comprehensive book giving a clear, concise idea of the principles governing the construction, installation, care and management of telephones and their appliances, this book has been compiled. It has been the aim of the author to make this the most complete elementary book on this subject for the practical electrician, wireman, lineman and engineer, and it is written in a clear and careful style.

HOPKINS, GEO. M.—Experimental Science. Elementary, Practical and Experimental Physics. 650 illustrations .....$4.00

HOPKINSON.—Original Papers on Dynamo Machinery and Allied Subjects. Illustrated.....$1.00

HOPKINSON, DR. JOHN.—Dynamic Electricity; Its Modern Use and Measurements, Chiefly in Its Application to Electric Lighting and Telegraphy.....$0.50

HORSTMANN, H. C. AND VICTOR H. TOUSLEY.—Modern Wiring Diagrams and Descriptions. Hand Book of Practical Diagrams and Information for Electrical Workers. 160 pages, over 200 illustrations. Full leather binding, pocket size 4x6.....$1.50

HOSPITALIER, E.—Domestic Electricity for Amateurs; Translated from the French, with additions by C. J. Wharton. With illustrations.....$2.50

HOUSTON, EDWIN J.—A Dictionary of Electrical Words, Terms and Phrases. Fourth edition, greatly enlarged, with over 6,000 additional words and definitions. 2 volumes, 1,000 pages .....$6.00

KAPP, GISBERT.—Electric Transmission of Energy and Its Transformation, Subdivision and Distribution. A practical hand book. Fourth edition.....$3.00

KAPP, GISBERT.—Alternate Current Machinery. Illustrated .....$0.50
(Vol. 96. Van Nostrand's Science Series.)

KAPP, GISBERT.—Dynamos, Alternators and Transformers. 138 illustrations .....$4.00

KEMPE, H. R.—A Hand Book of Electrical Testing. Fifth edition. 200 illustrations. 8vo, cloth. London, 1892 .....$7.25
In this edition there is a considerable amount of new matter; the old matter has been thoroughly revised.

KEMPE, H. R.—The Electrical Engineer's Pocket Book. Modern Rules, Formulæ, Tables, and Data. 32mo, leather .....$1.75

LOCKWOOD, T. D.—Electricity, Magnetism and Electric Telegraphy; a Practical Guide and Hand Book of General Information for Electrical Students, Operators and Inspectors. 376 pages, 152 illustrations.....$2.50

LOCKWOOD, T. D.—Electrical Measurement and the Galvanometer; Its Construction and Use. Second edition .....$1.50

LYNDON, L.—Storage Battery Engineering. A Practical Treatise for Engineers. This is a practical work, intended for the electrical engineer who is called on to design and install storage battery equipments, or who has a battery power plant under his care. Cloth. 360 pages, 178 illustrations and diagrams, 4 large folding plates. Price .....$3.00

MEADOWCROFT, W. H.—The A, B, C of Electricity. 36 illustrations. 12mo, cloth. New York.....$0.50

MAVER AND DAVIS, M. M.—The Quadruplex. With Chapters on the Dynamo-Electric Machine in Relation to the Quadruplex. The Practical Working of the Duplex Telegraph Repeaters and the Wheatstone Automatic Telegraph. 63 illustrations.....$1.50

MEYER, HENRY, C., JR., M. E.—Steam Power Plants. Their Design and Construction. Cloth. 165 pages, 63 illustrations, 15 folding plates. Price.....$2.00

MILLER, KEMPSTER B.—American Telephone Practice. 518 large octavo pages, 379 illustrations .....$3.00
This book treats of the subject in a simple and comprehensive manner from the practical standpoint, and almost entirely without the use of mathematics.

NOLL, AUGUSTUS.—How to Wire Buildings. A manual of the art of interior wiring. Illustrated .....$1.50

POPE, FRANKLIN LEONARD.—Modern Practice of the Electric Telegraph. A technical hand book for Electricians, Managers and Operators. 185 illustrations. Fourteenth edition, rewritten and enlarged.....$1.50

PRINDLE, H. B.—A Popular Treatise on the Electric Railway of To-day. Fully illustrated.....$0.25

REED, LYMAN C.—American Meter Practice. This is the only American book dealing with the theory and practice of current metering. Cloth. About 250 pages. Illustrated. Price .....$2.00

RUSSELL, STUART A.—Electric Light Cables and Distribution of Electricity. 107 illustrations.....$2.25

SALOMONS, SIR DAVID.—Electric Light Installations. Vol. I. The Management of Accumulators. A Practical Hand Book. Seventh edition, revised and enlarged. With illustrations. 12mo, cl. London, 1893.....$1.50

SLOANE, T. O'CONNOR.—Electricity Simplified. The Practice and Theory of Electricity, including a Popular Review of the Theory of Electricity, with Analogies and Examples of Its Practical Application in every day life. Illustrated .....$1.00

SLOANE, T. O'CONNOR.—The Standard Electrical Dictionary. A popular dictionary of words and terms used in the practice of electrical engineering. 350 illustrations .....$3.00

SLOANE, T. O'CONNOR.—Electric Toy Making for Amateurs, including Batteries, Magnets, Motors, Miscellaneous Toys .....$1.00

SLOANE, T. O'CONNOR.—The Arithmetic of Electricity. A Treatise of Practical Calculations by Methods and Methods, including numerous rules, examples and tables in the field of practical electrical engineering and experimenting. Third edition, revised.....$1.00

STEVENS, H. G.—Mechanical Guide. For Stationary and Marine Engineers, Firemen, Electricians, Motormen, Ice Machine Men and Mechanics in General. 336 pages, over 240 illustrations. Cloth.....$1.00

THOMPSON, SYLVANUS P.—Dynamo-Electric Machinery. A series of lectures, with an introduction by Franklin L. Pope. 16mo. Numerous illustrations, fancy boards (Van Nostrand's Science Series, No. 66).....$0.50

THOMPSON, SYLVANUS P.—Polyphase Electric Currents and Alternate-Current Motors. Mailed to any address in the world on receipt of.....$3.50

THOMPSON, SYLVANUS P.—Recent Progress in Dynamo-Electric Machines, being a Supplement to Dynamo-Electric Machinery. 16mo. (Van Nostrand's Science Series, No. 75).....$0.50

THOMPSON, SYLVANUS P.—Dynamo-Electric Machinery. Eighth edition, revised and rewritten. Numerous illustrations and 19 plates. Nearly 1000 pages.....$6.00

THURSTON, PROF. R. H.—Stationary Steam Engines, Especially Adapted to Electric Lighting Purposes. Treating of the development of Steam Engines, the Principle of Construction and Economy, with description of Moderate and High Speed Engines. With many folding plates .....$2.50

TREVERT.—How to Make Electric Batteries at Home. Illustrated .....$0.25

URQUHART.—Electro-Plating. A Practical Hand Book on the Deposition of Copper, Silver, Nickel, Gold, Aluminum, Brass, Platinum, etc. Second edition; carefully revised, with additions.....$2.00

WALKER, P.—Practical Dynamo Building, for Amateurs. How to wind for any output. With numerous illustrations. 16mo, boards. (Van Nostrand's Science Series, No. 98).....$0.50

WEBB, H. L.—A Practical Guide to the Testing of Insulated Wires and Cables. Illustrated.....$1.00
The only complete work on the Telephone. All possible information for any one interested in Telephones and how to make and operate them.

WEBER.—The Handy Vest Pocket Electrical Dictionary. Cloth .....$0.25
Leather .....$0.50

# THE TELEPHONE HAND-BOOK

**NEW AND REVISED EDITION, WITH A NEW CHAPTER ON "RECENT PROGRESS," BRINGING THE BOOK UP TO DATE.**

**BY HERBERT LAWS WEBB.**

*Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."*

## 160 Pages, 133 Illustrations, Cloth, Hand-Book Size, Price $1.00.

**Extract from Preface.**—"This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book on telephone working and management, and the TELEPHONE HAND-BOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice; and most of the material, apparatus and methods described are peculiar to or have originated in this country."

No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that anyone can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

CONTENTS

CHAPTER 1. The Invention of the Telephone.
2. Sound Waves. Articulate Speech.
3. Electric Telephony. The Bell Telephone.
4. The Microphone.
5. Current Induction. Electromagnetic Induction.
6. The Induction Coil: Its Use in the Telephone Transmitter.
7. The Complete Telephone Circuit.
8. Magnet Telephones.
9. The Bell Telephone Receiver.
10. Other forms of Magnet Telephones.
11. The Gower, Ader and D'Arsonval Receivers, Mercadier's Bi-Telephone.
12. The Siemens, Kotyra, Neumayer and Böttcher Receivers.

CHAPTER 13. Carbon Transmitters.
14. The Blake Transmitter.
15. The Long Distance Transmitter.
16. The Solid-back Transmitter.
17. The Berliner Transmitter.
18. The Cuttriss Transmitter.
19. Various European Transmitters.
20. The Efficiency of Carbon Transmitters.
21. Batteries for Telephone Work.
22. Open Circuit Batteries.
23. Closed Circuit Batteries.
24. The Practical Management of Batteries.
25. Magneto Bell.
26. Automatic Switches.
27. Telephone Line Construction.

CHAPTER 28. Metallic Circuit.
29. Underground Wires
30. Lightning Arresters.
31. Inside Wiring.
32. Installation of Telephone Instruments.
33. Inspection and Maintenance.
34. The Condenser; Its Use in Telephony.
35. Electromagnetic Retardation.
36. Exchange Working.
37. Small Exchanges.
38. Party Lines: The Bridging Bell.
39. Long Distance Telephony.
40. Duplex Telephony.
42. Simultaneous Telegraphy and Telephony.
42. Recent Progress. Appendix.

## A PRACTICAL BOOK FOR PRACTICAL MEN

### "MODERN WIRING DIAGRAMS AND DESCRIPTIONS FOR ELECTRICAL WORKERS."

By Henry C. Horstmann and Victor H. Tousley. 160 pages, over 200 illustrations. Full leather binding, red edges. Pocket size 4 x 6. Price, net, $1.50.

**A work that not only tells you how to do it, but shows you.**

THIS BOOK tells how to wire for call and alarm bells. For burglar and fire alarm. How to run bells from dynamo current. How to install and manage batteries. How to test batteries. How to test circuits. How to wire for enunciators; for telegraph and gas lighting. It tells how to locate "trouble" and "ring out" circuits. It tells about meters and transformers. It contains 30 diagrams of electric lighting circuits alone. It explains dynamos and motors; alternating and direct current. It gives 10 diagrams of ground detectors alone. It gives "Compensator" and Storage Battery installation. It gives simple and explicit explanations of the "Wheatstone Bridge" and its uses as well as volt meter and other testing. It gives a new and simple wiring table, covering all voltages and all loads or distances, etc., etc.

We install Municipal and Isolated Electric Lighting Plants.
We manufacture Switchboards, Table boards, Iron Cutout Boxes and Electrical Specialties.
We sell Dynamos, Motors and Electrical Supplies.
We wire old as well as new Residences, Factory Buildings, School and College Buildings.

**87 Fifth Avenue, Chicago, Illinois.**

# THE AUTOMATIC

is the recognized competitive system of telephony. Its manifold advantages over the manual system, mechanically, financially and commercially, make it so. Automatic telephone service is more prompt and more accurate and absolutely secret. It can be furnished at less cost to both company and patrons than any other. Progressive Independent telephone companies all over the country are rapidly adopting it; the new ones in preference to manual and the old ones to replace manual equipment. It is a success everywhere.

Among the cities in which it has been adopted are:

Chicago, Ill.
Grand Rapids, Mich.
Columbus, Ohio
Dayton, Ohio
Lincoln, Neb.
Portland, Maine
Auburn, N. Y.
Lewiston, Maine
Auburn, Maine
Fall River, Mass.
New Bedford, Mass.
Los Angeles, Cal.
San Diego, Cal.
Hopkinsville, Ky.
Sioux City, Iowa
Cleburne, Texas
Columbus, Ga.
Augusta, Ga.
Medford, Wis.
St. Mary's, Ohio
Woodstock, N. B.
Westerly, R. I.
Berlin, Germany
Manchester, Iowa
Princeton, N. J.
Albuquerque, N. M.
Van Wert, Ohio
Battle Creek, Mich.
Clayton, Mo.
Pentwater, Mich.
Toronto Junction, Can.
Wilmington, Del.
Riverside, Cal.
Traverse City, Mich.

Compiled by E. T. BUBIER, 2d.
ILLUSTRATED.
A Compilation from the works of Sylvanus P. Thompson, Kapp, Allsop, Munroe and Jamieson, Watson, Bottone, Bonney, Watt, Poole, Trevert, Haskins, Morrow and Reid, and others.

This book gives a large number of receipts for making Battery Fluids, Battery Pastes, Insulating Materials and Varnishes, Electro-Plating Solutions, etc. Tells how to make Electric Batteries, Bells, Telephone, Motors, Dynamos, Induction Coils, Influence and Static Machines, etc. Gives formulæ for winding Dynamos, Motors, Armatures, Field Magnets, Transformers. Contains many Rules, Tables, Data, etc. In fact it is almost a complete cyclopædia of Electricity. It is neatly bound and of a convenient size to be carried in the pocket for handy reference.

CONTENTS.

PART
1. History.
2. Theory.
3. Measurements. (Electric and Magnetic.)
4. Electric Batteries.
5. Electro-Chemistry and Metallurgy.
6. The Telegraph and Telephone.
7. Dynamos and Motors.
8. Management of Dynamos and Motors.
9. Electric Lighting.
10. Transformers.
11. Wiring for Electric Power.
12. Wiring for Bell Fitting and Gas Lighting
13. Electric Railways.
14. Miscellaneous.
15. Useful Tables.
16. Logarithms.

Contains over four hundred and fifty pages and many illustrations.

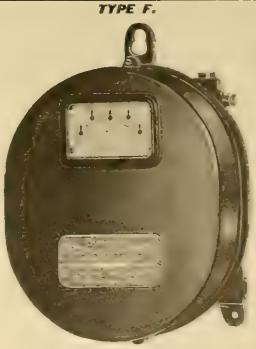
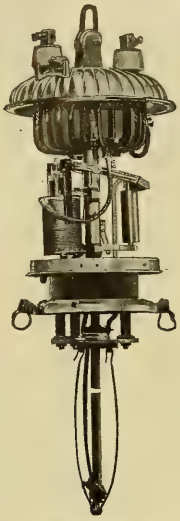
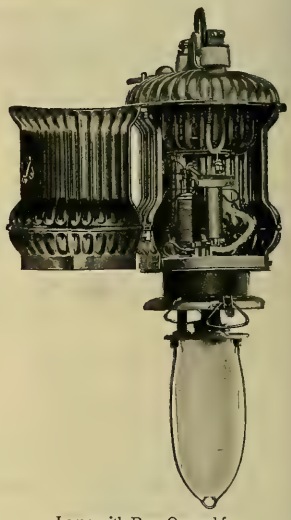
TYPE F.


DIRECT CURRENT.



Lamp Mechanism.

Multiple Alternating Arc Lamp with Opalescent Outer Globe.



Lamp with Door Opened for Inspection of Mechanism.

# The Westinghouse
## Multiple Alternating Arc Lamp

Quiet and steady operation.—Parts small in number and easy of access, facilitating inspection and adjustment.—Unexcelled insulation.—Each lamp subject to a ground test of 7,000 volts before shipment.

**The fireproof construction enables it to withstand any current passing through, with carbons in contact.**

FARIES MFG. CO.
DECATUR, ILL.

# Preeminently the Storage Battery

It costs no more than the Cell Type.

It has comparatively, considerably more active material and occupies less space (about half that required by Cell Type).

It is far more durable—is cleaner and more economical in operation and much less expensive in cost of maintenance.

Besides, this important fact must not be overlooked: There are no annoying and destructive fumes as with the Cell Type. The gas does not escape, therefore no corrosion of adjacent pipe or iron work or even the tarnishing of bright metal work.

## C.-H. "CARPENTER" CONTROLLER

FOR SMALL MOTORS

We've made some mechanical changes in the C-H "Carpenter" type of controller for motors from ½ to 3 H. P. which have resulted in making it more compact.

For operating printing presses and machine tools this controller has been a great success, many of the largest printing establishments in the country employing it exclusively. Bulletins 88 to 89½ describe the new type for small motors.

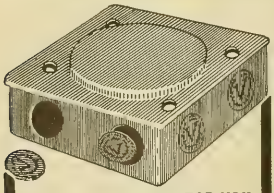
GENERAL SALES AGENTS

264-266-268-270 FIFTH AVENUE, CHICAGO

OKONITE IT NEVER DISAPPOINTS



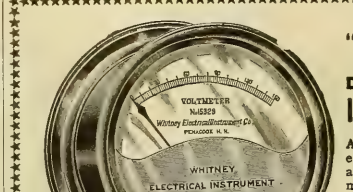
**FIVE CENTS A HOLE FOR YOU**

Perhaps you have never stopped to figure that every time you h mmer, file and rea- to get a round hole in a cast-iron junction box you waste about five cents worth of time to say nothing of the broken boxes. It costs you nothing to put holes in

**BOSSERT JUNCTION BOXES**

One blow of the hammer removes the hermetically sealed plug, leaving a su-oth round hole. The boxes are made of drawn steel and never break. This saving of five cents a hole amounts to a considerable sum in a year. Write for prices.

Bossert Electric Construction Co., Utica, N. Y.



Diam. of body, 6 in., of base flange 7½ in.

**THE "I. P." (ISOLATED PLANT) TYPE DIRECT-CURRENT INSTRUMENTS**

Are winners. Scales are equally divided, indications are dead beat, high range ammeters have separate shunts and the cases are of heavy polished brass.

Prices are right, the list figure for the meter illustrated, for instance, being $16.50.

**GREAT BARRINGTON, MASS., U.S.A.**

Present their new

## Rotary Jewel Bearing

Wattmeters for Alternating Current-Service

by which

**Permanent Accuracy at all loads**

is obtained.

**Jewel Bearing** is continuously

**Rotated by Train.**

**A New Jewel** surface is continuously automatically placed under disc staff pivot. Pivot cannot touch same spot on Jewel more than once in 1,000 kilowatt-hours.

Disc Staff Pivot is Spring Supported.
No increase of bearing friction can occur.
No change in Accuracy can occur.

**Such Result is Self Evident.**

The disc staff pivot in a meter of this construction (10-ampere capacity) has rotated on the Jewel bearing upwards of 150,000,000 times; the equivalent of more than 120,000 kilowatt-hours; equal at 10 cents per kilowatt-hour to a revenue of $12,000.00 from a 10-ampere meter, and no change of accuracy is perceptible at any load from 25 watts to 50% overload.

# Kohler Bros. Asked The Cutler-Hammer Mfg. Co.

**What they thought about the Cooper Hewitt Mercury Vapor Lamp and this is what they said:**

Milwaukee, Wis., Jan. 13, 1905

KOHLER BROS., Contracting Engineers, Chicago, Ill.
Gentlemen :— Re Cooper Hewitt Lamps.

We are in receipt of yours of the 12th inst., regarding Cooper Hewitt Lamps. At present we have our Draughting Room, Cost Department and one Department of our shop equipped with the Cooper Hewitt Lamps, which we find very satisfactory. We find that the strangeness of the light wears off in a very short time, and the draughtsmen, clerks and workmen as well pleased to the same. The light is very easy on the eyes, and, owing to the splendid diffusion obtained, no dark shadows are caused and the ability to see into and under objects by this light is suprisingly satisfactory.

The current consumption in the departments which are equipped with these lamps has been halved, and we have just placed our order for equipping the balance of our plant with these lamps.

Yours very truly,
THE CUTLER-HAMMER MFG. CO.

## THE LIGHT TO WORK BY

**For use in Factories, Machine Shops, Warehouses, Covered Piers, Draughting Rooms, Offices, Press and Composing Rooms and for Photographic and Engraving Work and Blue Printing.**

**Phillips Insulated Wire Co.**
Office and Factory: PAWTUCKET, R. I.

The traveling man who calls upon his possible customers at rare intervals is almost or entirely forgotten between times.

It is necessary for him to introduce himself at each visit.

Little drops of water will wear away a stone.

But the speed with which the stone is worn away is in proportion to the frequency with which the little drops fall.

The frequent ad produces a clear-cut and indelible impression upon the mind.

The infrequent ad produces a blurred impression.

The clear-cut impression remains.

The blurred impression disappears.

An ad in the Western Electrician goes 52 times a year to the possible purchaser of your product.

The busy, possible purchaser may have a poor memory. Your ad greets him frequently, lest he forget.

**WANTED, FOR SALE** *and similar* **WANT COLUMN** *advertisements (50 words or less), $1.50 an insertion; additional words 3c each.* **POSITION WANTED** *advertisements (50 words or less), $1.00 an insertion; additional words 2c each.*

## POSITION WANTED.

By a good electrical construction man, who knows how to hustle and handle men. Experienced in long distance transmission work, station and lines, rebuilding lighting service lines and installing transformers. Satisfaction to employers or no pay demanded. Address BOX 436, care of Western Electrician, 510 Marquette Bldg., Chicago.

## POSITION WANTED.

As assistant to superintendent or manager of electric railway, construction, or light and power company; age 28; eight years' experience with leading firms; graduate of mechanical and electrical engineering course; A-1 references. For particulars address BOX 434, care Western Electrician, 510 Marquette Bldg., Chicago.

## POSITION WANTED.

As superintendent or electrician of electric plant. Sixteen years' practical experience at line work, wiring, motors, meters, etc. Can estimate contract work. Never drink. Twelve years in present place. Good reason for change. Address BOX 438, care Western Electrician, 510 Marquette Building, Chicago.

## WANTED.

An experienced designer of large transformers. In reply state experience and salary required. Give references. Address BOX 435, care Western Electrician, 510 Marquette Bldg., Chicago, Ill.

## WANTED.

Two experienced electric-light, power and gas solicitors, by a gas and electric company, in a city of 175,000 population. Address BOX 437, care Western Electrician, 510 Marquette Building, Chicago.

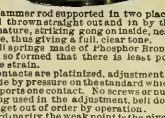
## EDWARDS and Co

The R. E. A. L. Monitor Bell. (Patented.)



Hammer rod supported in two places and thrown straight out and in by the armature, striking gong on inside, near edge, thus giving a full, clear tone.

All springs made of Phosphor Bronze and so formed that there is least possible strain.

Contacts are platinized, adjustment is made by pressure on the standard which supports one contact. No screws or nuts being used in the adjustment, bell does not get out of order by operation.

Ordinarily the weak point is the pivot, the unreliable one the adjusting screw and nut. As these defects have been eliminated, this bell will stand hard usage and operate under adverse conditions.

The hammer entirely concealed by gong and cannot be tampered with.

It is especially adapted for use on street cars, as in addition to the advantages mentioned, it is dust, insect and moisture proof.

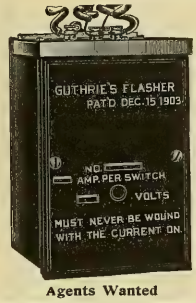
It Can't Be Beat—The Guthrie Flasher
A SIGN FLASHER WITHOUT A MOTOR



A FEW ADVANTAGES OF THIS FLASHER OVER ALL OTHERS:
*First.*—The Price is lower.
*Second.*—It has fewer parts and is therefore the simplest flasher on the market.
*Third.*—It has no motor to cause trouble and consume current.
*Fourth.*—It costs nothing to operate this flasher.
*Fifth.*—It only occupies a space of 5 x 8 inches.
*Sixth.*—It can be regulated to flash any signs or show window lights in any manner desired.
Any combination of lights, without motor or cylinder.
Simplest and best on the market.
Works on any current.
The disadvantage of a flasher was the motor question.
We have overcome this and are putting out an article that meets a long felt want.

# THE TELEPHONE HAND-BOOK

NEW AND REVISED EDITION, WITH A NEW CHAPTER ON "RECENT PROGRESS," BRINGING THE BOOK UP TO DATE.

BY HERBERT LAWS WEBB.

*Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."*

**160 Pages, 133 Illustrations, Cloth, Hand-Book Size, Price $1.00.**

**Extract from Preface.**—"This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book on telephone working and management, and the TELEPHONE HAND-BOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice; and most of the material, apparatus and methods described are peculiar to or have originated in this country."

No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that anyone can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

CONTENTS

CHAPTER 1. The Invention of the Telephone.
2. Sound Waves. Articulate Speech.
3. Electric Telephony. The Bell Telephone.
4. The Microphone.
5. Current Induction. Electromagnetic Induction.
6. The Induction Coil: Its Use in the Telephone Transmitter.
7. The Complete Telephone Circuit.
8. Magnet Telephones.
9. The Bell Telephone Receiver.
10. Other forms of Magnet Telephones.
11. The Gower, Ader and D'Arsonval Receivers, Mercadier's Bi-Telephone.
12. The Siemens, Kotyra, Neumayer and Böttcher Receivers.
13. Carbon Transmitters.
14. The Blake Transmitter.
15. The Long Distance Transmitter.
16. The Solid-back Transmitter.
17. The Berliner Transmitter.
18. The Cuttriss Transmitter.
19. Various European Transmitters.
20. The Efficiency of Carbon Transmitters.
21. Batteries for Telephone Work.
22. Open Circuit Batteries.
23. Closed Circuit Batteries.
24. The Practical Management of Batteries.
25. Magneto Bell.
26. Automatic Switches.
27. Telephone Line Construction.
28. Metallic Circuit.
29. Underground Wires
30. Lightning Arresters.
31. Inside Wiring.
32. Installation of Telephone Instruments.
33. Inspection and Maintenance.
34. The Condenser; Its Use in Telephony.
35. Electromagnetic Retardation.
36. Exchange Working.
37. Small Exchanges.
38. Party Lines: The Bridging Bell.
39. Long Distance Telephony.
40. Duplex Telephony.
41. Simultaneous Telegraphy and Telephony.
42. Recent Progress. Appendix.

LOS ANGELES CLEVELAND PHILADELPHIA

# IMPORTANT TELEPHONE BOOKS.

THE TELEPHONE HANDBOOK. By Herbert Laws Webb. 16mo, 150 pp. Price $1.00.
This handbook is a reliable treatise on telephony, and a practical book on telephone working and management, based entirely on standard American practice. It is extremely useful to telephone inspectors and operators.

AMERICAN TELEPHONE PRACTICE. By Kempster B. Miller, M. E. 510 pp. 380 illustrations. Price $3.00.
This is the first complete treatise on telephony in the English language. The text is profusely illustrated by cuts of commercial apparatus and carefully prepared diagrams of circuits. No diagram is given without a full explanation. The apparatus, circuits and methods of the American Bell Telephone Company and of the various independent companies are fully described. The apparatus and methods used in making all of the tests required in commercial telephone work are fully treated.

THE INSPECTOR AND TROUBLE MAN. By A. E. Dobbs. 106 pp. Price $1.00.
A practical book, written in plain language. Full of information and diagrams for the operator, exchange manager, inspector, trouble man and lineman. A complete description of telephones, how to find and remedy their troubles, together with working plans for exchange construction, complete with diagrams of all up-to-date telephones and switchboards.

A, B, C, OF THE TELEPHONE. By J. E. Homans, A. M. 352 pp. 263 illustrations. Price $1.00.
Owing to the demand for a comprehensive book giving a clear, terse idea of the principles governing the construction, installation, care and management of telephones and their appliances, this book has been compiled. It has been the aim of the author to make this the most complete elementary book on the subject for the practical electrician, wireman, lineman and engineer, and it is written in a clear and careful style.

THE PRACTICAL TELEPHONE HANDBOOK. By Joseph Poole, A. I. E. E. Second edition, revised and enlarged. 360 pp. 288 illustrations. Price $1.50.
In this work the writer has endeavored to produce a manual of moderate size and cost, but thoroughly practical, and detailing, as far as space will allow, the most recent methods of telephone working. While the requirements of telephone employes have been kept constantly in view it is fully intended also that the book shall be of service as a source of information on telephonic matters to users of the telephone and to the public generally.

PRACTICAL FEATURES OF TELEPHONE WORK. By A. E. Dobbs. 134 pp. Price 75 cents.
A simple, plain-speaking handbook for the practical telephone man.

TELEPHONE TROUBLES AND HOW TO FIND THEM. A complete handbook for telephone inspectors. By W. Hyde and J. H. McManman, edited by Prof. C. H. Haskins. Eighth edition. 16mo. 98 pp. Price 25 cents.
This little volume is an extremely practical work for telephone employes, written in a popular style and devoid of technicalities.

TELEPHONE LINES AND THEIR PROPERTIES. By Wm. J. Hopkins. Sixth edition. 272 pp. Illustrated. Price $1.50.

A MANUAL OF TELEPHONY. A new and large edition. By W. H. Preece, F. R. S., and A. J. Stubbs. 768 pp. 333 illustrations. Price $4.50.

TELEPHONES, THEIR CONSTRUCTION AND FITTING. A Practical Manual on the Fitting Up and Maintenance of Telephone and Auxiliary Apparatus. By F. C. Allsop. 191 pp. 168 illustrations. Price $1.25.

PATENTED TELEPHONY. A Review of the Patents Pertaining to Telephones and Telephonic Apparatus. Published by the American Electrical Engineering Association. Cloth bound; fully illustrated. Price, $1.50.

THE ELECTRIC TELEPHONE. By E. J. Houston, Ph. D., and A. E. Kennelly, Sc. D. 12mo, cloth, 422 pp. 142 illustrations. Price $1.00.

HOW TO MAKE AND USE THE TELEPHONE. By Geo. H. Cary. 136 pp.; illustrated. Price $1.00.

**The Above, or Any Other Electrical Work Published, Sent on Receipt of Price.**

**ELECTRICIAN PUBLISHING CO., 510 MARQUETTE BLDG., CHICAGO.**

# THE AUTOMATIC

is the recognized competitive system of telephony. Its manifold advantages over the manual system, mechanically, financially and commercially, make it so. Automatic telephone service is more prompt and more accurate and absolutely secret. It can be furnished at less cost to both company and patrons than any other. Progressive Independent telephone companies all over the country are rapidly adopting it; the new ones in preference to manual and the old ones to replace manual equipment. It is a success everywhere.

Among the cities in which it has been adopted are:

Chicago, Ill.
Grand Rapids, Mich.
Columbus, Ohio
Dayton, Ohio
Lincoln, Neb.
Portland, Maine
Auburn, N. Y.
Lewiston, Maine
Auburn, Maine
Fall River, Mass.
New Bedford, Mass.
Los Angeles, Cal.
San Diego, Cal.
Hopkinsville, Ky.
Sioux City, Iowa
Cleburne, Texas
Columbus, Ga.
Augusta, Ga.
Medford, Wis.
St. Mary's, Ohio
Woodstock, N. B.
Westerly, R. I.
Berlin, Germany
Manchester, Iowa
Princeton, N. J.
Albuquerque, N. M.
Van Wert, Ohio
Battle Creek, Mich.
Clayton, Mo.
Pentwater, Mich.
Toronto Junction, Can.
Wilmington, Del.
Riverside, Cal.
Traverse City, Mich.

FIVE CENTS A HOLE FOR YOU
Perhaps you have never stopped to figure that every time you hammer, file and ream to get a round hole in a cast-iron junction box you waste about five cents worth of time to say nothing of the broken boxes. It costs you nothing to put holes in
BOSSERT JUNCTION BOXES
One blow of the hammer removes the hermetically sealed plug, leaving a smooth round hole. The boxes are made of drawn steel and never break. This saving of five cents a hole amounts to a considerable sum in a year. Write for prices.
Bossert Electric Construction Co., Utica, N. Y.

*Some Changes in the*

**C.-H. "CARPENTER" CONTROLLER**

FOR SMALL MOTORS

We've made some mechanical changes in the C-H "Carpenter" type of controller for motors from ½ to 3 H. P. which have resulted in making it more compact.

For operating printing presses and machine tools this controller has been a great success, many of the largest printing establishments in the country employing it exclusively. Bulletins 88 to 89½ describe the new type for small motors.

THE CUTLER-HAMMER MFG. CO., MILWAUKEE, WIS.

NEW YORK BOSTON CHICAGO PITTSBURG

TYPE K TRANSFORMER

# PITTSBURGH TRANSFORMERS

have been on the market [illegible] eration in the electrical business. There is only one other manufacturer who has made a transformer good enough to stand a seven years run, and that fact simply shows that there are two kinds of transformers—Pittsburgh and the other kind.

STICK TO THE PITTSBURGH.

# Read What the Butterick Publishing Co. Think About the Cooper Hewitt Mercury Vapor Lamp.

New York, January 17, 1905.

COOPER HEWITT ELECTRIC COMPANY,
220 West 29th Street, New York.

Gentlemen

Referring to your request of recent date, asking our opinion as to the value of the light for printing in black, we beg to say that after making an exhaustive test of the arc, incandescent and Cooper Hewitt mercury vapor lamps, in our Webb press rooms for this purpose, we decided to use your lamps there for the following reasons:

**On account of the excellent quality of the light.**

**We can detect defects in black printing under your lamps, which are not noticeable under either the arc or the incandescent.**

**The large saving of current used, being a substantial economy.**

**Our employes in the Webb press rooms prefer it because of its softness and steadiness, as it does not affect their eyes detrimentally.**

We expect shortly to take up the question of lighting some of our other departments with your lamps.

Yours respectfully,

THE BUTTERICK PUBLISHING CO., Ltd., Per M. R. O'Loughlin.

## The Light To Work By

For use in Factories, Machine Shops, Warehouses, Covered Piers, Drafting Rooms, Offices, Press and Composing Rooms and for Photographic and Engraving Work and Blue Printing.

GLACKNER BUILDING NEW YORK

There is no race suicide among ideas.

Ideas are prolific.

Each idea gives birth to a brood.

They multiply and replenish the earth.

The electrical business is based on ideas.

The gray matter in electrical craniums is active gray matter.

But two craniums are better than one—and a thousand are better than two.

The wide-awake man who carefully peruses the Western Electrician acquires the ideas of others. He is informed of the progress that is being made in every branch of electricity.

As a reading man he is intelligent. He is a man of ideas.

Some ideas are born too soon. They are undeveloped, sickly, puny.

In the incubator cranium of a thinking man they become strong and healthy.

They live and are useful.

Each number of the Western Electrician contains an installment of the latest and best electrical ideas.

It tells the story of the thinkers.

**WANTED, FOR SALE** *and similar* **WANT COLUMN** *advertisements (50 words or less), $1.50 an insertion; additional words 3c each.* **POSITION WANTED** *advertisements (50 words or less), $1.00 an insertion; additional words 2c each.*

## POSITION WANTED.

As superintendent or electrician of electric plant. Sixteen years' practical experience at line work, wiring, motors, meters, etc. Can estimate contract work. Never drink. Twelve years in present place. Good reason for change. Address BOX 438, care Western Electrician, 510 Marquette Building, Chicago.

## POSITION WANTED.

By an experienced meter, arc lamp and repair man, 22 years of age, 5 years' practical experience around electric-lighting plant, can furnish good reference. Address BOX 443 care of Western Electrician, 510 Marquette Building, Chicago.

## POSITION WANTED.

Electrical and mechanical engineer, associate member A. I. E. E. and A. S. M. E., now holding position of general manager and engineer of several consolidated companies, desires to connect himself with new or operating companies: 14 years' experience in the construction and operation of lighting and street-railroad properties in this country and South America; competent to design, construct and manage same; Mexico preferred. Address BOX 442, care of Western Electrician, 510 Marquette Building, Chicago.

## WANTED.

Two experienced electric-light, power and gas solicitors, by a gas and electric company, in a city of 175,000 population. Address BOX 437, care Western Electrician, 510 Marquette Building, Chicago.

## WANTED.

Second-hand, modern type, 100 K. W. 3-phase 60 cycle, 2,200-volt generator. Address ROCKPORT WATER WORKS CO., Rockport, Ind.

## WANTED.

A 200 to 300 kilowatt rotary converter, 60 cycles, three phase to 550 volts direct, complete with transformers for 2,300 volts primary. Address BOX 440, care Western Electrician, 510 Marquette Building, Chicago.

## FOR SALE.

One 25 H.P. Nash gas engine, direct-connected to 15-K.W. Crocker-Wheeler dynamo; can be used for 115 or 230 volts. This would be a first-class outfit for automobile charging station. GRAHAM BROS. CO., 662 Hudson St., New York City.

## FOR SALE.

Fuller engine Western Electric, 15 K.W., direct-connected unit, used 9 months, good as new must have larger machine. HOTEL WARNER, Chicago.

## Standard Electrical Dictionary.

BY PROF. T. O'CONOR SLOANE.
Author of "Arithmetic of Electricity," "Electricity Simplified," "Electric Toy Making," Etc.

682 Pages, 393 Illustrations. Handsomely bound in cloth, 8vo, $3.

**An Entirely New Edition, Brought Up to Date and Greatly Enlarged.**

COMPLETE—CONCISE—CONVENIENT.

In publishing the "Standard Electrical Dictionary," the author has adhered to what the work purports to be, exhausting the subject of electrical terms, giving each title the clearness of explanation necessary to make the understanding of it complete without unnecessary elaboration. In this work, every electrical word, term, or phrase will be found intelligently defined.

A practical handbook of reference, containing definitions of about 5,000 distinct words, terms and phrases.

The work is absolutely indispensable to all in any way interested in electrical science, from the higher electrical expert to the everyday electrical workman. In fact, it should be in the possession of all who desire to keep abreast with the progress of this branch of science.

ELECTRICIAN PUBLISHING CO., 510 Marquette Bldg., Chicago.

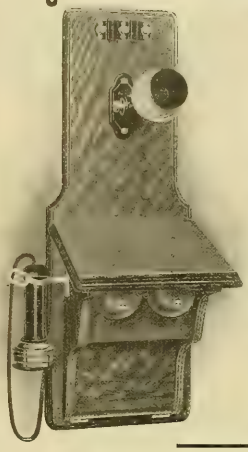
# STROMBERG-CARLSON QUALITY IS STANDARD



We are willing you should be your own judge of this if you will get our toll board bulletin, still you should see the apparatus itself to fully appreciate it.

It will please you to see how business-like we take care of the small details.

Many of these things you will observe in the bulletin, others you can only see by examining the apparatus.

If you are not interested in this, why let us mail you our bulletins on some other subject.

***For the above ask for BULLETIN NO. 12-E.***

LOS ANGELES CLEVELAND PHILADELPHIA

# THE TELEPHONE HAND-BOOK

**NEW AND REVISED EDITION, WITH A NEW CHAPTER ON "RECENT PROGRESS," BRINGING THE BOOK UP TO DATE.**

**BY HERBERT LAWS WEBB.**

*Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."*

**160 Pages, 133 Illustrations, Cloth, Hand-Book Size, Price $1.00.**

**Extract from Preface.**—"This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book on telephone working and management, and the TELEPHONE HAND-BOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice; and most of the material, apparatus and methods described are peculiar to or have originated in this country."

No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that anyone can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

CONTENTS

CHAPTER 1. The Invention of the Telephone.
2. Sound Waves. Articulate Speech.
3. Electric Telephony. The Bell Telephone.
4. The Microphone.
5. Current Induction. Electromagnetic Induction.
6. The Induction Coil: Its Use in the Telephone Transmitter.
7. The Complete Telephone Circuit.
8. Magnet Telephones.
9. The Bell Telephone Receiver.
10. Other forms of Magnet Telephones.
11. The Gower, Ader and D'Arsonval Receivers, Mercadier's Bi-Telephone.
12. The Siemens, Kotyra, Neumayer and Böttcher Receivers.
CHAPTER 13. Carbon Transmitters.
14. The Blake Transmitter.
15. The Long Distance Transmitter.
16. The Solid-back Transmitter.
17. The Berliner Transmitter.
18. The Cutiriss Transmitter.
19. Various European Transmitters.
20. The Efficiency of Carbon Transmitters.
21. Batteries for Telephone Work.
22. Open Circuit Batteries.
23. Closed Circuit Batteries.
24. The Practical Management of Batteries.
25. Magneto Bell.
26. Automatic Switches.
27. Telephone Line Construction.
CHAPTER 28. Metallic Circuit.
29. Underground Wires
30. Lightning Arresters.
31. Inside Wiring.
32. Installation of Telephone Instruments.
33. Inspection and Maintenance.
34. The Condenser; Its Use in Telephony.
35. Electromagnetic Retardation.
36. Exchange Working.
37. Small Exchanges.
38. Party Lines: The Bridging Bell.
39. Long Distance Telephony.
40. Duplex Telephony.
41. Simultaneous Telegraphy and Telephony.
42. Recent Progress. Appendix.

# THE AUTOMATIC

is the recognized competitive system of telephony. Its manifold advantages over the manual system, mechanically, financially and commercially, make it so. Automatic telephone service is more prompt and more accurate and absolutely secret. It can be furnished at less cost to both company and patrons than any other. Progressive Independent telephone companies all over the country are rapidly adopting it; the new ones in preference to manual and the old ones to replace manual equipment. It is a success everywhere.

Among the cities in which it has been adopted are:

Chicago, Ill.
Grand Rapids, Mich.
Columbus, Ohio
Dayton, Ohio
Lincoln, Neb.
Portland, Maine
Auburn, N. Y.
Lewiston, Maine
Auburn, Maine
Fall River, Mass.
New Bedford, Mass.
Los Angeles, Cal.
San Diego Cal
Hopkinsville, Ky.
Sioux City, Iowa
Cleburne, Texas
Columbus, Ga.
Augusta, Ga.
Medford, Wis.
St. Mary's, Ohio
Woodstock, N. B.
Westerly, R. I.
Berlin, Germany
Manchester, Iowa
Princeton, N. J.
Albuquerque, N. M.
Van Wert, Ohio
Battle Creek, Mich.
Clayton, Mo.
Pentwater, Mich.
Toronto Junction, Can.
Wilmington, Del.
Riverside, Cal.
Traverse City, Mich.

**AUTOMATIC ELECTRIC COMPANY**

# THE BEST BRAZING TORCH

FOR ELECTRICIANS

## HOTTEST ON EARTH

The Turner 4B Gasoline Brazing Torch is used by all mechanics for light work in brazing, annealing, tempering and drawing temper of small tools, etc. This torch produces an intensely hot, pointed flame of over 3,000° Fahr. Burns 4 hours from one filling.

**PRICE $4.50 NET**

# ANNOUNCEMENT

It gives us pleasure to announce to our friends and patrons that while the fire of Feb'y 11th completely destroyed our offices and warehouse and temporarily interfered with our facilities, ***it did not put us out of business*** and we will not allow it to interfere with our taking care of your orders promptly.

We are temporarily established at Nos. 209-211 E. Jackson Boulevard, and now have everything running smoothly again—with a full new stock of supplies. We have made arrangements to take care of all orders promptly and hope therefore we will continue to receive the generous support that our trade has at all times given us.

## THE SPARKLESS STARTER FOR LARGE MOTORS

Our experience has taught us that the sliding contact type of starter is not the best to use on motors above 35 H. P. 110 volts, and 50 H. P. 220 and 500 volts.

For motors of greater H. P. than these we advise our Multiple Switch type, which doesn't spark, and each switch of which will carry 250 amperes per square inch of contact surface.

Its interlocking mechanism makes it necessary to close switches in their proper order, and a no-voltage magnet automatically releases switches when current is interrupted.

Bulletin 101 gives detailed description.

## Preeminently the Storage Battery

It costs no more than the Cell Type.

It has comparatively, considerably more active material and occupies less space (about half that required by Cell Type).

It is far more durable—is cleaner and more economical in operation and much less expensive in cost of maintenance.

Besides, this important fact must not be overlooked: There are no annoying and destructive fumes as with the Cell Type. The gas does not escape, therefore no corrosion of adjacent pipe or iron work or even the tarnishing of bright metal work.

MONEY-SAVING
**Benjamin Drop-Light Sockets**
**And Some Reasons "Why"**

431. Key Socket.

1.—By extending the fiber lining of the cap through the neck a perfect insulation is obtained without necessitating the use of a socket bushing.

2.—Instead of side terminals as are commonly employed in sockets, the terminals of the BENJAMIN DROP-LIGHT SOCKETS are so placed on the back face of the porcelain that the removal of the lower shell is not necessary, making it the most easily wired socket on the market for **drop-light work.**

430. Keyless Socket.

3.—Our proposition on Standard Packages of 250 sockets will interest you. Will you write for it today?

4.—We can make prompt deliveries.

5.—If you have not used them we know you are losing money daily.

CLACKNER BUILDING NEW YORK

Several years ago a down-east manufacturer of belting—one of the ultra-conservative kind—did not believe in advertising. He had an idea that belting could be sold in but one way—through personal calls by representatives on the road.

The belting was of good quality—in fact it was and is one of the best on the market.

Every little while one of his road men would enter the office of a belting user who would tell him he had never heard of —— belting. He had never seen the belting advertised, and consequently did not know there was such a belting on the market.

Cases of this kind happened so frequently as to become annoyingly monotonous.

The road representatives finally got their heads together and drafted a sort of round-robin, politely demanding that the home office commence advertising in the trade papers.

The demand was complied with, and as a result, the sales during the following twelve months increased 75 per cent.

This is a true story—and it has a general application.

Advertising paves the way for the man on the road.

Advertising in the WESTERN ELECTRICIAN will pave the way for your representatives in the Central, Western and Southern States.

**WANTED, FOR SALE** *and similar* **WANT COLUMN** *advertisements (50 words or less), $1.50 an insertion; additional words 3c each.* **POSITION WANTED** *advertisements (50 words or less), $1.00 an insertion; additional words 2c each.*

## POSITION WANTED.

As engineer and electrician in lighting or power plant. Age 32. Twelve years' experience with high and low-speed compound-condensing engines, high and low tensions A. C. and D. C. systems, water works and water power plants. Have first-class indicating outfit and well supplied with engine-room tools. Six years with present company; strictly temperate; best of references. Address H. G. CHILDS, 715 Washtenaw St., Lansing, Mich.

## FIVE CENTS A HOLE FOR YOU

Perhaps you have never stopped to figure that every time you hammer, file and ream to get a round hole in a cast-iron junction box you waste about five cents worth of time to say nothing of the broken boxes. It costs you nothing to put holes in

**BOSSERT JUNCTION BOXES**

One blow of the hammer removes the hermetically sealed plug, leaving a smooth round hole. The boxes are made of drawn steel and never break. This saving of five cents a hole amounts to a considerable sum in a year. Write for prices.

Bossert Electric Construction Co., Utica, N. Y.

# Perkins' Socket Patent Sustained by U. S. Circuit Court of Appeals.

The U. S. Circuit Court of Appeals in Philadelphia has handed down an opinion affirming the Court below, sustaining our Socket Patent, No. 626,927, and holding the so-called "Dixon" Socket, formerly made by the Yost-Miller Co., to be an infringement. The Yost Electric Mfg. Co., of Toledo, Ohio, succeeded to the business of the Yost-Miller Co. and defended this "Dixon" Socket suit and put out a socket under the name "Yost," which we claim is substantially the same as the "Dixon." We are actively pushing a suit against the Yost Electric Mfg. Co. for this infringement of our patent which has thus been sustained by the Appellate Court.

Chicago Office, Old Colony Bldg.
Ampere, N. J.

It Can't Be Beat—The Guthrie Flasher
A SIGN FLASHER WITHOUT A MOTOR

A FEW ADVANTAGES OF THIS FLASHER OVER ALL OTHERS:
*First.*—The Price is lower.
*Second.*—It has fewer parts and is therefore the simplest flasher on the market.
*Third.*—It has no motor to cause trouble and consume current.
*Fourth.*—It costs nothing to operate this flasher.
*Fifth.*—It only occupies a space of 5 x 8 inches.
*Sixth.*—It can be regulated to flash any signs or show window lights in any manner desired.
Any combination of lights, without motor or cylinder.
Simplest and best on the market.
Works on any current.
The disadvantage of a flasher was the motor question.
We have overcome this and are putting out an article that meets a long felt want.

# THE TELEPHONE HAND-BOOK

**NEW AND REVISED EDITION, WITH A NEW CHAPTER ON "RECENT PROGRESS," BRINGING THE BOOK UP TO DATE.**

**BY HERBERT LAWS WEBB.**

*Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."*

**160 Pages, 133 Illustrations, Cloth, Hand-Book Size, Price $1.00.**

**Extract from Preface.**—"This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it felt that there is a demand for a practical book on telephone working and management, and the TELEPHONE HAND-BOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice; and most of the material, apparatus and methods described are peculiar to or have originated in this country."

No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that anyone can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

CONTENTS

CHAPTER 1. The Invention of the Telephone.
2. Sound Waves. Articulate Speech.
3. Electric Telephony. The Bell Telephone.
4. The Microphone.
5. Current Induction. Electromagnetic Induction.
6. The Induction Coil: Its Use in the Telephone Transmitter.
7. The Complete Telephone Circuit.
8. Magnet Telephones.
9. The Bell Telephone Receiver.
10. Other forms of Magnet Telephones.
11. The Gower, Ader and D'Arsonval Receivers, Mercadier's Bi-Telephone.
12. The Siemens, Kotyra, Neumayer and Böttcher Receivers.
13. Carbon Transmitters.
14. The Blake Transmitter.
15. The Long Distance Transmitter.
16. The Solid-back Transmitter.
17. The Berliner Transmitter.
18. The Cuttriss Transmitter.
19. Various European Transmitters.
20. The Efficiency of Carbon Transmitters.
21. Batteries for Telephone Work.
22. Open Circuit Batteries.
23. Closed Circuit Batteries.
24. The Practical Management of Batteries.
25. Magneto Bell.
26. Automatic Switches.
27. Telephone Line Construction.
28. Metallic Circuit.
29. Underground Wires
30. Lightning Arresters.
31. Inside Wiring.
32. Installation of Telephone Instruments.
33. Inspection and Maintenance.
34. The Condenser; Its Use in Telephony
35. Electromagnetic Retardation.
36. Exchange Working.
37. Small Exchanges.
38. Party Lines: The Bridging Bell.
39. Long Distance Telephony.
40. Duplex Telephony.
41. Simultaneous Telegraphy and Telephony.
42. Recent Progress. Appendix.

# THE AUTOMATIC

is the recognized competitive system of telephony. Its manifold advantages over the manual system, mechanically, financially and commercially, make it so. Automatic telephone service is more prompt and more accurate and absolutely secret. It can be furnished at less cost to both company and patrons than any other. Progressive Independent telephone companies all over the country are rapidly adopting it; the new ones in preference to manual and the old ones to replace manual equipment. It is a success everywhere.

Among the cities in which it has been adopted are:

Chicago, Ill.
Grand Rapids, Mich.
Columbus, Ohio
Dayton, Ohio
Lincoln, Neb.
Portland, Maine
Auburn, N. Y.
Lewiston, Maine
Auburn, Maine
Fall River, Mass.
New Bedford, Mass.
Los Angeles, Cal.
San Diego, Cal.
Hopkinsville, Ky.
Sioux City, Iowa

## FROM POLE TO GROUND

**It is but a few minutes work to put a Type A transformer into service, and once in place it stays there.**

***But*—if it is ever necessary to remove it from service to test or change capacity, it is just as easily detached from the pole. The new patented suspension hooks require no nuts or bolts to attach to transformer lugs. It is all done by locking cams with a hammer blow. *The man on the pole* need stay there only long enough to unlock the cams and sling the transformer. *The boy on the ground* to care for wrenches and cold chisels is not needed.**

Type H—6 Lamp.

## Cooper Hewitt
## Mercury Vapor Lamps

are being adopted wherever wide diffusion of light is necessary. In the new New York Times Building these lamps are used in the press rooms several stories below ground and the Butterick Publishing Co. have installed it with great success in several departments.

There is no consumption of the light-giving element; no trimming is required.

Twice the efficiency of the arc lamp and from 7 to 9 times the efficiency of the incandescent.

For use on all direct-current systems.

## THE LIGHT TO WORK BY

**For use in Factories, Machine Shops, Warehouses, Covered Piers, Draughting Rooms, Offices, Press and Composing Rooms and for Photographic and Engraving Work and Blue Printing.**

Office and Factory: PAWTUCKET, R. I.

One billion dollars a year is spent in advertising in the United States. The expenditure of this enormous and almost unthinkable sum has contributed more than all other causes combined to the rapid and phenomenal commercial growth of the country.

The American appreciates the value of publicity. He knows that money spent in continuous and judicious advertising is an investment that will bring returns of increasing value. He knows, too, that it is impossible for him to do business without the assistance of printer's ink.

Most of the largest commercial concerns have grown from small beginnings. Their growth has been chiefly due—in some cases wholly due—to advertising of the right kind.

They told the people that they had something to sell; and the people bought.

Tell your electrical tale to the readers of the Western Electrician. They will buy.

**WANTED, FOR SALE** *and similar* **WANT COLUMN** *advertisements (50 words or less), $1.50 an insertion; additional words 2c each.* **POSITION WANTED** *advertisements (50 words or less), $1.00 an insertion; additional words 2c each.*

## POSITION WANTED.

As engineer and electrician in lighting or power plant. Age 32. Twelve years' experience with high and low-speed compound-condensing engines, high and low tensions A. C. and D. C. systems, water works and water power plants. Have first-class indicating outfit and well supplied with engine-room tools. Six years with present company; strictly temperate; best of references. Address H. G. CHILDS, 715 Washtenaw St., Lansing, Mich.

## POSITION WANTED.

Electrical and mechanical engineer, associate member A. I. E. E. and A. S. M. E., now holding position of general manager and engineer of several consolidated companies, desires to connect himself with new or operating companies; 14 years' experience in the construction and operation of lighting and street-railroad properties in this country and South America; competent to design, construct and manage same; Mexico preferred. Address BOX 442, care of Western Electrician, 510 Marquette Building, Chicago.

## POSITION WANTED.

As engineer. Thirteen years' experience in operating and repairing steam engines, boilers, pumps, gasoline engine saw mill and other machinery. Four months' experience in electrical plant. Sober and have first-class license. Satisfaction to employer or no pay. References can be had if wanted. Address J. A. THOMPSON, Benson, Minn.

## FOR SALE.

Fuller engine—Western Electric, 15 K. W., direct-connected unit, used 9 months, good as new—must have larger machine. HOTEL WARNER, Chicago.

## A PRACTICAL BOOK
### FOR PRACTICAL MEN
### "MODERN WIRING DIAGRAMS AND DESCRIPTIONS FOR ELECTRICAL WORKERS."

By Henry C. Horstmann and Victor H. Tousley. 160 pages, over 200 illustrations. Full leather binding, red edges. Pocket size 4 x 6. Price, net, $1.50.

**A work that not only tells you how to do it, but shows you.**

THIS BOOK tells how to wire for call and alarm bells. For burglar and fire alarm. How to run bells from dynamo current. How to install and manage batteries. How to test batteries. How to test circuits. How to wire for enunciators; for telegraph and gas lighting. It tells how to locate "trouble" and "ring out" circuits. It tells about meters and transformers. It contains 30 diagrams of electric lighting circuits alone. It explains dynamos and motors; alternating and direct current. It gives 10 diagrams of ground detectors alone. It gives "Compensator" and Storage Battery Installation. It gives simple and explicit explanations of the "Wheatstone Bridge" and its uses as well as Volt meter and other testing. It gives a new and simple wiring table, covering all voltages and all losses or distances, etc., etc.

# SAMSON TURBINE

The illustration shows the large NIAGARA design, HORIZONTAL SHAFT TURBINES recently installed by us, for the TELLURIDE POWER TRANSMISSION CO. power station, Logan, Utah. Tests conducted by competent engineers developed as follows:

| HEAD. | GATEAGE. | SPEED, | H. P. | GENERATOR EFFICY. | TURBINE EFFICY. |
|---|---|---|---|---|---|
| 211.5 ft. | ½ | 400 r.p.m. | 1038 | 95.20 | 73.80 |
| 209.7 ft. | ¾ | 400 r.p.m. | 1560 | 96.50 | 83.50 |
| 208.9 ft. | Full | 400 r.p.m. | 1677 | 96.70 | 80.57 |

These results have never been equaled by any turbine of the Horizontal Shaft Design, operating under equally HIGH HEADS. The test was made AFTER TURBINES WERE INSTALLED, direct coupled to Generators. Frames, wheels and formula for discharge were used. The original test reports on file at our offices. These turbines are all fitted with our SAMSON BALANCED GATES. Note especially the UNIFORM SPEED AT ALL GATEAGES.

# IMPORTANT TELEPHONE BOOKS

THE TELEPHONE HANDBOOK. By Herbert Laws Webb. 16mo, 150 pp. Price $1.00.
This handbook is a reliable treatise on telephony, and a practical book on telephone working and management, based entirely on standard American practice. It is extremely useful to telephone inspectors and operators.

AMERICAN TELEPHONE PRACTICE. By Kempster B. Miller, M. E. 510 pp. 380 illustrations. Price $3.00.
This is the first complete treatise on telephony in the English language. The text is profusely illustrated by cuts of commercial apparatus and carefully prepared diagrams of circuits. No diagram is given without a full explanation. The apparatus, circuits and methods of the American Bell Telephone Company and of the various independent companies are fully described. The apparatus and methods used in making all of the tests required in commercial telephone work are fully treated.

THE INSPECTOR AND TROUBLE MAN. By A. E. Dobbs. 106 pp. Price $1.00.
A practical book, written in plain language. Full of information and diagrams for the operator, exchange manager, inspector, trouble man and lineman. A complete description of telephones, how to find and remedy their troubles, together with working plans for exchange construction, complete with diagrams of all up-to-date telephones and switchboards.

A, B, C, OF THE TELEPHONE. By J. E. Homans, A. M. 352 pp. 269 illustrations. Price $1.00.
Owing to the demand for a comprehensive book giving a clear, terse idea of the principles governing the construction, installation, care and management of telephones and their appliances, this book has been compiled. It has been the aim of the author to make this the most complete elementary book on the subject for the practical electrician, wireman, lineman and engineer, and it is written in a clear and careful style.

THE PRACTICAL TELEPHONE HANDBOOK. By Joseph Poole, A. I. E. E. Second edition, revised and enlarged. 360 pp. 288 illustrations. Price $1.50.
In this work the writer has endeavored to produce a manual of moderate size and cost, but thoroughly practical, and detailing, as far as space will allow, the most recent methods of telephone working. While the requirements of telephone employes have been kept constantly in view it is fully intended also that the book shall be of service as a source of information on telephonic matters to users of the telephone and to the public generally.

PRACTICAL FEATURES OF TELEPHONE WORK. By A. E. Dobbs. 134 pp. Price 75 cents.
A simple, plain-speaking handbook for the practical telephone man.

TELEPHONE TROUBLES AND HOW TO FIN THEM. A complete handbook for telephone inspector By W. Hyde and J. H. McManman, edited by Prof. C. Haskins. Eighth edition. 16mo, 48 pp. Price 25 cents.
This little volume is an extremely practical work fo telephone employes, written in a popular style and devo of technicalities.

TELEPHONE LINES AND THEIR PROPERTIE By Wm. J. Hopkins. Sixth edition. 272 pp. Illustrate Price $1.50.

A MANUAL OF TELEPHONY. A new and large ec tion. By W. H. Preece, F. R. S., and A. J. Stubbs. 5 pp. 333 illustrations. Price $4.50.

TELEPHONES, THEIR CONSTRUCTION AND FI TING. A Practical Manual on the Fitting Up and Mai tenance of Telephone and Auxiliary Apparatus. By F. Allsop. 191 pp. 168 illustrations. Price $1.25.

PATENTED TELEPHONY. A Review of the Patents Pe taining to Telephones and Telephonic Apparatus. Publishe by the American Electrical Engineering Association. Clot bound; fully illustrated. Price, $1.50.

THE ELECTRIC TELEPHONE. By E. J. Houston, Ph. D and A. E. Kennelly, Sc. D.; 12mo, cloth, 422 pp., 142 illustra tions. Price $1.00.

HOW TO MAKE AND USE THE TELEPHONE. By Geo. Cary. 136 pp.; illustrated. Price $1.00.

Designers and Manufacturers, of Sheetmetal, Electric and Machinery Specialties.

# THE AUTOMATIC

is the recognized competitive system of telephony. Its manifold advantages over the manual system, mechanically, financially and commercially, make it so. Automatic telephone service is more prompt and more accurate and absolutely secret. It can be furnished at less cost to both company and patrons than any other. Progressive Independent telephone companies all over the country are rapidly adopting it; the new ones in preference to manual and the old ones to replace manual equipment. It is a success everywhere.

Among the cities in which it has been adopted are:

Chicago, Ill.
Grand Rapids, Mich.
Columbus, Ohio
Dayton, Ohio
Lincoln, Neb.
Portland, Maine
Auburn, N. Y.
Lewiston, Maine
Auburn, Maine
Fall River, Mass.
New Bedford, Mass.

**Adjustable Speeds**

**Ceiling Types**

**Alternating Current, 4 Blades, 65-inch Sweep, One Speed**
**Direct Current, 4 Blades, 58-inch Sweep, Two Speeds**

## Deliver The Most Air For Least Current Consumed

In the Desk and Bracket types the blades are constructed on engineering principles, distributing the pressure over entire surface. The fan bodies are mounted on trunions in the exact center of gravity, and are easily adjusted by one thumb nut. They may be changed from desk to bracket types, and vice versa, without disconnecting leads, and all parts of both types are alike and interchangeable, excepting the blades and guards.

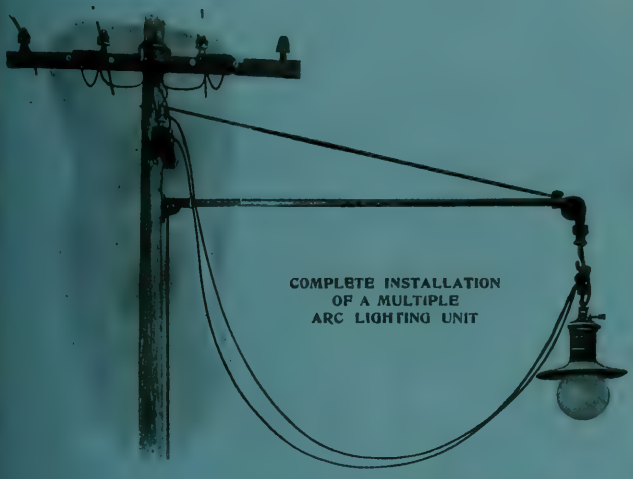
# FORT WAYNE MULTIPLE ARC

## ALTERNATING CURRENT STREET LIGHTING SYSTEM



COMPLETE INSTALLATION OF A MULTIPLE ARC LIGHTING UNIT

**The Fort Wayne Multiple System of alternating current enclosed arc street lighting was designed to fill a very frequent demand for a simple, inexpensive method of lighting small towns or isolated sections of larger places.**

It is a 3-wire single-phase high-tension transmission system with a 2-wire or 3-wire secondary distribution for incandescent lighting and a 2-wire multiple arc lighting circuit for each lamp.

The arc lighting circuit consists of one of the incandescent mains and an additional third wire connected at the switchboard to the other side of the incandescent lighting circuit through a single-pole switch.

**In many instances it is desirable to locate arc lamps in places where arc circuits are not installed. In such cases a Type MA transformer with Form C arc lamp is installed directly on the incandescent primary circuit.**

This requires no extra expense for special wiring or extension of arc light circuit already in use elsewhere. In installing this system a third wire is run with the two wires for incandescent lighting and the arc lighting unit connected between the third wire and one of the incandescent wires. The only extra station equipment is one switch controlling the arc circuit.

**There are no regulating devices in the station except the switch, and nothing to get out of order or cause trouble in any way on the line or in the station. The arc lamp transformers furnish the regulation and protection to lamps.**

**This System is Worth Investigating. Write us.**

## Fort Wayne Electric Works

"WOOD" LIGHTING AND POWER SYSTEMS FORT WAYNE, INDIANA

221

### A Few Advantages of the Multiple Street Arc Lighting System

1. High efficiency.
2. Extreme simplicity.
3. Efficiency the same for all loads.
4. Power factor the same for all loads.
5. Absolute cut-outs are not required with the lamps.
6. Lamps of various candle-powers can be installed on the same circuit.
7. The number of lamps that can be installed on a circuit is limited only by generator capacity.
8. Station appliances reduced to a minimum, which reduces first cost of installation.
9. Lamp in secondary or low-tension circuit is safe to handle, and insulation strain is reduced to a minimum.
10. Trouble with one lamp will not interfere with the operation of any other lamps of the system, as they are independent units.
11. Primary and secondary coils separated from each other by air space obviates chance of electrical connection between them.
12. Apparent energy varies directly with the number of lamps in operation, which always maintains the consumed generator capacity at a minimum.
13. Arc lamps can be placed in suburban districts without extra expense for wiring, as the transformer and arc lamp can be operated directly from the incandescent mains.
14. Transformer maintains practically constant energy in secondary with wide variations of resistance in secondary circuit. It can be short-circuited without damage to either transformer or arc light.

Dead Beat Accurate, Durable Guaranteed

List Price, $6.00 including leather case.

Sample Instrument forwarded prepaid on receipt of $5.00.

Discount to Dealers

THE ROBERT INSTRUMENT CO.

56 Shelby Street DETROIT - MICH.

**Water-Wheel Governors**

Our new mechanical governors co-operate with the inertia effect of the water and the momentum of the plant. They have cut the cost of good government in two. Guaranteed in every particular.

REPLOGLE GOVERNOR WORKS

AKRON, OHIO.

WRITE FOR DESCRIPTIVE MATTER W.

**WESTON Electrical Instrument Co.,**

Waverly Park, NEWARK, N. J.

Weston Portable Galvanometer for Bridge Work.

**Weston Standard Portable Direct Reading**

Voltmeters, Millivoltmeters, Voltammeters, Ammeters, Milammeters,

Ground Detectors and Circuit Testers,

Ohmmeters, Portable Galvanometers.

Our Portable Instruments are recognized as **The Standard** the world over. The **Semi-Portable Laboratory Standards** are still better

Our **Station Voltmeters and Ammeters** are unsurpassed in point of extreme accuracy and lowest consumption of energy.

BERLIN—European Weston Electrical Instrument Co., Ritterstrasse No. 86.

LONDON—Elliott Bros., Century Works, Lewisham.

PARIS, FRANCE—E. H. Cadiot, 12 Rue St. Georges.

**New York Office—74 Cortlandt St.**

**It Can't Be Beat—The Guthrie Flasher**

A SIGN FLASHER WITHOUT A MOTOR

A FEW ADVANTAGES OF THIS FLASHER OVER ALL OTHERS:

*First.*—The Price is lower.
*Second.*—It has fewer parts and is therefore the simplest flasher on the market.
*Third.*—It has no motor to cause trouble and consume current.
*Fourth.*—It costs nothing to operate this flasher.
*Fifth.*—It only consumes a spare of [illegible] minutes.
*Sixth.*—It can be regulated to flash any number or show [illegible] in any [illegible] time.

Any combination of lights without motor or cylinder.
Simplest and best on the market.
Works on any current.
The disadvantage of a flasher was the motor question. We have overcome this and are now turning out an article that meets a long felt want.

A. S. DOXSEE ELECTRICAL CO.

1108-1110 Pine St., ST. LOUIS

## CONSTANT USE OF THE C-H. FIELD REGULATOR HAS PROVEN

That the material of which its base is made does not allow grounding; that overloads do not disintegrate it; that it readily radiates and conducts heat, and is a perfect insulator. Its construction is such that no trouble can exist from small parts or contacts. Bulletin 32 explains in detail.

Type H—6 Lamp.

## Cooper Hewitt
### Mercury Vapor Lamps

are being adopted wherever wide diffusion of light is necessary. In the new New York Times Building these lamps are used in the press rooms several stories below ground and the Butterick Publishing Co. have installed it with great success in several departments.

There is no consumption of the light-giving element; no trimming is required.

Twice the efficiency of the arc lamp and from 7 to 9 times the efficiency of the incandescent.

For use on all direct-current systems.

## THE LIGHT TO WORK BY

**For use in Factories, Machine Shops, Warehouses, Covered Piers, Draughting Rooms, Offices, Press and Composing Rooms and for Photographic and Engraving Work and Blue Printing.**

**"Flexduct" is that high standard required in all high-class work. It is very flexible, a high insulation and indestructible**

# FLEXIBLE CONDUIT

**"Flexduct" the National Code Standard. It does not deteriorate, always usable to highest degree**

## OSBURN FLEXIBLE CONDUIT COMPANY,

**NEW YORK CHICAGO SAN FRANCISCO**

## Preeminently the Storage Battery

It costs no more than the Cell Type.

It has comparatively, considerably more active material and occupies less space (about half that required by Cell Type).

It is far more durable—is cleaner and more economical in operation and much less expensive in cost of maintenance.

Besides, this important fact must not be overlooked: There are no annoying and destructive fumes as with the Cell Type. The gas does not escape, therefore no corrosion of adjacent pipe or iron work or even the tarnishing of bright metal work.

*Motor Booklet No. 2538*

NORTHERN ELECTRICAL MFG. CO. ENGINEERS MANUFACTURERS
Madison, Wis., U. S. A.
425 Monadnock Block, CHICAGO

The fact that a youngster is born with a wooden leg does not conclusively prove that its sire fought and bled for his country.

The fact that a man buys a particular headache powder at the corner pill shop does, however, conclusively prove that that particular headache powder is well advertised.

Whether you want to buy a steam engine, a dynamo, or a cake of soap, you will buy that which is extensively advertised. It is not necessarily the best, although advertised most, but as a rule the best things are advertised best and most.

If you want to buy, you will make no mistake in buying that which is extensively advertised.

If you want to sell—and have something of merit—advertise it first, last and all the time—and chuckle as your business grows. Most pessimists advertise little or not at all. Most optimists advertise much.

Advertising in the Western Electrician makes optimists of pessimists and substitutes smiles for frowns.

**WANTED, FOR SALE** *and similar* **WANT COLUMN** *advertisements (50 words or less), $1.50 an insertion; additional words 3c each.* **POSITION WANTED** *advertisements (50 words or less), $1.00 an insertion; additional words 2c each.*

## POSITION WANTED.

All-around electrician and steam engineer as superintendent of a lighting and power plant. Have indicator and electric testing instruments, eight years' practical experience in constructing and operating central stations. Best references, married, thirty years old, temperate, reliable, know the business thoroughly and can put your system on a paying basis. Address box 446, care of Western Electrician, 510 Marquette Bldg., Chicago.

## POSITION WANTED.

In plant either steam or water power. Several years all around experience. Expert meter reader. Would consider position reading meters, or would take charge of plant. No less than $65.00 per month considered. Married man, steady and do not drink. Address BOX 447, care of Western Electrician, 510 Marquette Bldg., Chicago.

## FOR SALE.

Electric-light plant in a growing county seat town of 3,000 population in eastern Iowa. Good water power, also steam for emergency. 150 H.P. Corliss engine; franchise and city contract. This is worth investigating, as owner must go to different climate. Address BOX 445, care of Western Electrician, 510 Marquette Bldg., Chicago.

## FOR SALE CHEAP.

# CARHARTT OVERALL FACTORY MADE CO-OP-

*Hamilton Carhartt, Manufacturer, (Incorporated,) One of the Strongest and Most Prosperous American Industrial Institutions, Offers to take into Partnership in his Business, his Employees, his Agents and the Men who Wear his Goods.*

## Send for Prospectus and Option Certificate.

Stock in Hamilton Carhartt, Manufacturer, (Incorporated), of Detroit, Michigan, preferred for 7% is offered to his Employees, Agents and the men who wear his goods.

**Details.** The capitalization of Hamilton Carhartt, Manufacturer, (incorporated), is $500,000. Of this two-thirds is common stock owned by Mr. Carhartt. One-third is preferred stock for 7% and is now being sold to interested parties at par, $10 per share. Under the laws governing corporations, Mr. Carhartt cannot receive a dollar in dividends from the Company until preferred stockholders have been paid their 7% dividends.

**Reasons.** This is now the greatest business of its kind in the world, and Mr. Carhartt naturally desires that it so remain for an indefinite period. Therefore, it has been necessary to incorporate the business in order to insure its perpetuation, and at the same time carry out Mr. Carhartt's idea of taking into partnership those who have helped him build up his gigantic business. In this manner the organization will become a stable, corporate entity, unaffected by individual changes. In this manner the ability, capital and experience of many widely differing classes of people will be available—yet all will be bound together by the common purpose of increasing the power and prestige of this business. Experience has shown that this is the only method of insuring the permanency and rapid growth of a commercial institution manufacturing an article of universal consumption.

**Security.** The entire capitalization of the preferred stock is more than covering by actual, tangible assets —real estate, plant, equipment, stock, etc. Leaving the business of the Company altogether out of consideration, the stockholder is absolutely protected against loss by the property of the Company upon which preferred stock is by law in the position of a first mortgage after indebtedness is paid.

**Dividends.** The 7% dividends upon the preferred stock cannot fail to be paid even in times of financial stringency. For fifteen years this business has not failed to pay more than 7% on the entire capital involved, and the business is increasing and becoming more profitable every day, becoming stronger and stronger in its position as the merits of the Hamilton Carhartt Overalls become known, and this increasing prosperity Mr Carhartt is willing to share with those who have helped him.

**Large Profits.** We feel this preferred stock is as safe as any investment in America, but at the same time it pays double the dividends of other investments of similar soundness. The savings bank is no better, and savings banks pay but 3 or 3½%. Remember that this stock, although offered at par is, on the basis of actual earnings, worth a great deal more, and will increase in value.

**Investigation.** The affairs of this Company, its books and records, are open to the investigation of the prospective purchaser of this stock. Nothing is hidden and nothing is left unexplained. The investor may satisfy himself thoroughly upon every possible point, and will have the full and cheerful assistance of this Company in so doing

**Promptness.** As this stock not only represents safety, but large dividends, it will be very attractive to the shrewdest investors, and it is difficult to say how long the opportunity to purchase will remain open. Promptness is, therefore, necessary The matter should not be deferred.

**Option.** By filling out the attached coupon, stating the number of shares desired, and giving name and address, the Company will grant an option of thirty days and forward a certificate to that effect This will give time for thought and investigation No obligation is incurred by the coupon or the certificate

**Prospectus of the Company explains all these matters in detail. Write for it, and read it.**

**Address for prospectus, option certificate, and full information, and send subscriptions and certified checks to**

## Hamilton Carhartt, Manufacturer,

(INCORPORATED.)

DETROIT, MICHIGAN, U. S. A.

Money begins to draw interest the day it is received Dividends are paid January 15th and July 15th If you do not want to wait for the prospectus, send the money and certificates of stock will be sent you by return mail

(COUPON.)

Hamilton Carhartt, Manufacturer, Inc.

Detroit, Michigan.

Please send prospectus of the Hamilton Carhartt Manufacturing, Incorporated, and specimen copy of your [illegible] telling me how to purchase stock. I will within thirty days [illegible] shares of the 7% preferred stock of the Company, at $10.00 per share. It is understood that this request incurs no obligation on my part unless, after investigation, I subscribe for the stock.

# IMPORTANT TELEPHONE BOOKS.

THE TELEPHONE HANDBOOK. By Herbert Laws Webb. 16mo. 150 pp. Price $1.00.
This handbook is a reliable treatise on telephony, and a practical book on telephone working and management, based entirely on standard American practice. It is extremely useful to telephone inspectors and operators.

AMERICAN TELEPHONE PRACTICE. By Kempster B. Miller, M. E. 510 pp. 380 illustrations. Price $3.00.
This is the first complete treatise on telephony in the English language. The text is profusely illustrated by cuts of commercial apparatus and carefully prepared diagrams of circuits. No diagram is given without a full explanation. The apparatus, circuits and methods of the American Bell Telephone Company and of the various independent companies are fully described. The apparatus and methods used in making all of the tests required in commercial telephone work are fully treated.

THE INSPECTOR AND TROUBLE MAN. By A. E. Dobbs. 106 pp. Price $1.00.
A practical book, written in plain language. Full of information and diagrams for the operator, exchange manager, inspector, trouble man and lineman. A complete description of telephones, how to find and remedy their troubles, together with working plans for exchange construction, complete with diagrams of all up-to-date telephones and switchboards.

A, B, C, OF THE TELEPHONE. By J. E. Homans, A. M. 352 pp. 289 illustrations. Price $1.00.
Owing to the demand for a comprehensive book giving a clear, terse idea of the principles governing the construction, installation, care and management of telephones and their appliances, this book has been compiled. It has been the aim of the author to make this the most complete elementary book on the subject for the practical electrician, wireman, lineman and engineer, and it is written in a clear and careful style.

THE PRACTICAL TELEPHONE HANDBOOK. By Joseph Poole, A. I. E. E. Second edition, revised and enlarged. 360 pp. 288 illustrations. Price $1.50.
In this work the writer has endeavored to produce a manual of moderate size and cost, but thoroughly practical, and detailing, as far as space will allow, the most recent methods of telephone working. While the requirements of telephone employes have been kept constantly in view it is fully intended also that the book shall be of service as a source of information on telephonic matters to users of the telephone and to the public generally.

PRACTICAL FEATURES OF TELEPHONE WORK. By A. E. Dobbs. 134 pp. Price 75 cents.
A simple, plain-speaking handbook for the practical telephone man.

TELEPHONE TROUBLES AND HOW TO FIND THEM. A complete handbook for telephone inspectors. By W. Hyde and J. H. McManman, edited by Prof. C. H. Haskins. Eighth edition. 16mo, 48 pp. Price 25 cents.
This little volume is an extremely practical work for telephone employes, written in a popular style and devoid of technicalities.

TELEPHONE LINES AND THEIR PROPERTIES. By Wm. J. Hopkins. Sixth edition. 272 pp. Illustrated. Price $1.50.

A MANUAL OF TELEPHONY. A new and large edition. By W. H. Preece, F. R. S., and A. J. Stubbs. 508 pp. 333 illustrations. Price $4.50.

TELEPHONES, THEIR CONSTRUCTION AND FITTING. A Practical Manual on the Fitting Up and Maintenance of Telephone and Auxiliary Apparatus. By F. C. Allsop. 191 pp. 168 illustrations. Price $1.25.

PATENTED TELEPHONY. A Review of the Patents Pertaining to Telephones and Telephonic Apparatus. Published by the American Electrical Engineering Association. Cloth bound; fully illustrated. Price, $1.50.

THE ELECTRIC TELEPHONE. By E. J. Houston, Ph. D., and A. E. Kennelly, Sc. D.; 12mo, cloth, 422 pp., 142 illustrations. Price $1.00.

HOW TO MAKE AND USE THE TELEPHONE. By Geo. H Cary. 136 pp.; illustrated. Price $1.00.

ELECTRICIAN PUBLISHING COMPANY, 510 Marquette Building, Chicago

# THE AUTOMATIC

is the recognized competitive system of telephony. Its manifold advantages over the manual system, mechanically, financially and commercially, make it so. Automatic telephone service is more prompt and more accurate and absolutely secret. It can be furnished at less cost to both company and patrons than any other. Progressive Independent telephone companies all over the country are rapidly adopting it; the new ones in preference to manual and the old ones to replace manual equipment. It is a success everywhere.

Among the cities in which it has been adopted are:

Chicago, Ill.
Grand Rapids, Mich.
Columbus, Ohio
Dayton, Ohio
Lincoln, Neb.
Portland, Maine
Auburn, N. Y.
Lewiston, Maine
Auburn, Maine

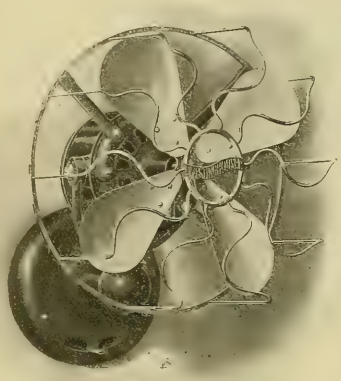
# Westinghouse Fan Motors

## Alternating and Direct Current

# Season 1905



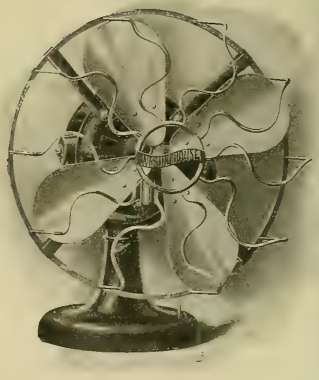
### 12-in. and 16-in. Desk and Bracket Types
Adjustable Speeds

### Ceiling Types

**Alternating Current, 4 Blades, 65-inch Sweep, One Speed**
**Direct Current, 4 Blades, 58-inch Sweep, Two Speeds**

## Deliver The Most Air For Least Current Consumed

In the Desk and Bracket types the blades are constructed on engineering principles, distributing the pressure over entire surface. The fan bodies are mounted on trunnions in the exact center of gravity, and are easily adjusted by one thumb nut. They may be changed from desk to bracket types, and vice versa, without disconnecting leads, and all parts of both types are alike and interchangeable, excepting the blades and guards.



## A Written Guarantee Accompanies Each Fan

200-Kw., 48-Pole, 2,300-Volt, Revolving Field Engine Type Multiphase Alternator

## Direct and Alternating Current

## Generating Apparatus

No matter what system of lighting by electricity is planned we have a generator that will give the current required. Power requirements are also fully served by our efficient, reliable types of D. C. and A. C. generators and motors of all kinds.

**Detailed Information Ready for all Inquiries**

**Main Office: Fort Wayne, Ind.** **Branch Offices:** Chicago, St. Louis, St. Paul, San Francisco, Cincinnati, Pittsburg, Atlanta, Grand Rapids, Syracuse, Philadelphia, New York, Boston.

## Worth Having!

# STEVENS' MECHANICAL CATECHISM

PRACTICAL KNOWLEDGE

FOR

Stationary and Marine Engineers, Firemen, Electricians, Motormen, Ice Machine Men and Mechanics in General.

New and Original. All Modern Machinery fully described and explained. Technical Points made Clear by Word and Drawing. Questions and Answers for Civil Service Examinations, etc.

SUBJECTS TREATED:

WATER, STEAM, COMBUSTION, SMOKE PREVENTION, BOILERS, BOILER CONSTRUCTION, TESTING AND MANAGEMENT, SAFETY VALVES, INJECTORS, PUMPS AND GOVERNORS, STEAM GAUGES, LUBRICATORS, ENGINES, COMMON SLIDE VALVE, TANDEM COMPOUND, CROSS COMPOUND, RECEIVER ENGINES, HOT AIR AND COMPRESSED AIR ENGINES, TRACTION ENGINES, ELECTRIC ENGINES, AUTOMATIC AND CORLISS ENGINES, CONDENSERS, JET AND SURFACE, ECCENTRIC, BALANCED SLIDE VALVE, LINK MOTION, HORSE POWERS IN DETAIL, INDICATOR, REFRIGERATION, ABSORPTION AND COMPRESSION METHODS, BRINE AND DIRECT EXPANSION SYSTEMS, PUMPS, VALVES, TESTS, TABLES, AMMONIA, AMMONIA FITTINGS, LIQUID AIR, MACHINE SHOP PRACTICE, STANDARD NUMBERS AND RULES, PULLEY SPEED CALCULATION, SQUARE ROOT, LEVERAGE, ELECTRICITY, DYNAMOS, ACCUMULATOR, RHEOSTAT, TRANSFORMER, VARIETIES OF DYNAMOS, PARALLEL AND SERIES WIRING, THREE-WIRE SYSTEM, MANAGEMENT AND CARE OF ELECTRIC PLANT, REPAIRS, ELECTRICAL MEASUREMENTS, MOTORS, STATIONARY, TROLLEY AND THIRD RAIL SYSTEMS, CONTROLLER, ELECTRIC LOCOMOTIVE, ELECTRIC HEATING AND COOKING, HOUSE WIRING, DIFFERENTIAL GEAR, FRICTION CLUTCH, COMPOUND CYLINDERS, REVERSING GEAR, THE STACKER. ALSO, THE ELEMENTS OF ALGEBRA MADE EASY.

336 Pages. 240 Illustrations.

**PRICE, $1.00.** Sent anywhere prepaid on receipt of price.

## CONSTANT USE OF THE C-H. FIELD REGULATOR HAS PROVEN

That the material of which its base is made does not allow grounding; that overloads do not disintegrate it; that it readily radiates and conducts heat, and is a perfect insulator. Its construction is such that no trouble can exist from small parts or contacts. Bulletin 32 explains in detail.

# COLUMBIA LAMPS

## GIVE MOST LIGHT

Columbia Lamps stand for quality, uniformity and all other features so essential to the satisfactory and economical operation of Electric light plants. Place a trial order for a case or larger quantity, subject to our guarantee, and be convinced that the Columbia is all that we claim for it.

Licensed Under
Patent No. 537,693. April 16, '95
Patent No. 723,293. April 28, '03
Patent No. 444,590. Jan. 13, '91
Patent No. 532,760. Jan. 22, '95

Do not overlook the fact that Columbia Lamps will give greater total candle power (illumination from all angles) than other lamps on the market, and without any increase in current consumption.
THIS IS A FACT

LOOK FOR THE LICENSE LABEL IN THE STEM

Send for our Catalogue of Crystal Lamps (Meridian type).

We are prepared to furnish a complete line of Pagoda Reflectors and Holophane Globes. Write for prices.

Copy of our "Wallet Full of Wisdom" mailed on request.

**HOLOPHANE GLASS CO.**
CLACKNER BUILDING NEW YORK

A does not advertise because business is good. His plant is being operated to its full capacity. He could not fill additional orders if he had them. He believes in advertising when business is poor, as he then needs the advertising.

B does not advertise because business is so poor that he cannot afford it. This is his "off" season. He says he will advertise when business improves.

C advertises all the time — year in and year out, — when business is poor and when business is good. When it is poor he advertises to make it good. When it is good he advertises to keep it good or make it better. His business is generally good. It is never very poor, although it may fluctuate in volume.

D never advertises. He does not believe in it, and never did believe in it. His credit is poor. For some time past his business has been running at a loss; and it is rumored that it will soon be in the hands of a receiver.

C'S ad can be found in each and every issue of the Western Electrician.

**WANTED, FOR SALE** *and similar* **WANT COLUMN** *advertisements (50 words or less), $1.50 an insertion; additional words 3c each.*
**POSITION WANTED** *advertisements (50 words or less), $1.00 an insertion; additional words 2c each.*

## POSITION WANTED.

An industrious young man with 6 years' experience in meter, arc lamp and repair department of electric-lighting plant desires a position; can furnish good references. Address BOX 449, care of Western Electrician, 510 Marquette Bldg., Chicago.

## WANTED.

Electrician. — A first-class, up-to-date and energetic man, capable of taking foremanship in repair shop; must be familiar with all branches of armature and field windings and machine work in connection with electrical repair work in general; only those qualified to fill the above position need apply. Address, stating full particulars, to Graham Bros. Co., 662 Hudson St., New York City.

## FOR SALE.

Electric Light Plant, in up-to-date little city in Central Illinois. Just got a new five-year city contract for lighting the streets at $90.00 a year per lamp. Gross income over $8,000 a year and can be easily increased. A first-class business proposition. Good reasons for selling. Address BOX 542, Henry, Ill.

## FOR SALE.

One 25-H. P. Nash gas engine, direct-connected to 15-K. W. Crocker-wheeler dynamo; can be used for 115 or 230 volts. This would be a first-class outfit for automobile charging station. GRAHAM BROS. CO., 662 Hudson St., New York City.

## FOR SALE.

Consulting electrical and mechanical engineering firm of Chicago desires to sell out its established engineering business. Address BOX 448, care of Western Electrician, 510 Marquette bldg., Chicago.

## TO CONTRACTORS.

Sealed proposals will be received at the office of the Business Manager of the Board of Education, room 730 Tribune Building, southeast corner of Dearborn and Madison streets, up to the hour of 12 o'clock noon sharp of Friday, March 24th, 1905, for the following school work:

**WENDELL PHILLIPS HIGH SCHOOL**

For furnishing, setting and connecting 2 5-lt. and 2 3-lt. government standard bronze electroliers complete with globes as may be selected.

**WILLIAM McKINLEY HIGH SCHOOL**

For furnishing, setting and connecting 2 3-lt. electroliers with globes.

The above work is to be in accordance with plans and specifications prepared by the Chief Engineer, which may be seen at his office, room 710 Tribune Building, southeast corner Dearborn and Madison streets.

Proposals must be made on the regular printed forms to be obtained at the office of the Chief Engineer and must be in strict accordance with instructions to bidders printed thereon. All proposals must be enclosed in envelopes furnished for the purpose, properly indorsed, and must be sealed.

All proposals must be accompanied by appropriate deposits as hereinafter provided: On proposals of $100 or less, 20 per cent.; between $100 and $200, 15 per cent.; between $200 and $500, 10 per cent.; between $500 and $2,000, five per cent.; above $2,000, three per cent. Deposits must be in the form of cash or certified check, drawn upon some banking institution in good standing, doing business in Chicago, and made payable to the order of the Board of Education.

No proposal will be received after the hour specified in this advertisement. The Board reserves the right to reject any or all proposals or any portion of any proposal submitted.

COMMITTEE ON BUILDING AND GROUNDS,
Chicago, March 6, 1905.

# ELECTRICITY FOR ENGINEERS.

**Latest Edition, Now Published in One Complete Volume, 424 Pages, Profusely Illustrated. Just the Work for Engineers, Electricians, Dynamo Tenders, etc.**

**PART I. CONTENTS.**—CHAPTER I: Electricity; Positive and Negative; Conductors, Non-Conductors and Insulators; Electro-Motive Force; Volts; Resistance; Ohms; Current; Amperes.—CHAPTER II: Dynamos; Magnets; Field Coils; Electro Magnets; Permanent Magnets.—CHAPTER III: Armatures, Construction of, Different Kinds of, Commutators, How Made and Connected; Heating of Armatures; Eddy Currents.—CHAPTER IV: The Current; How Produced; Induction; Series Wound Dynamos; Shunt Wound Dynamos; Exciting the Fields; Constant Current and Constant Potential Dynamos; Series and Parallel; Parallel or Multiple Arc System.—CHAPTER V: Incandescent Lamps; Filaments; Connections; Flashing; Exhausting; Testing; Candle Power; Operated in Series; Automatic Cut-Out; In Multiple Arc or Parallel; Multiple Series; Multiple Series Cut-Out; Three Wire System.—CHAPTER VI: The Arc Light; How Formed; Causes of Unsteadiness; Remedy; Effect of Shades or Globes; Shape of Carbons Under Different Conditions of Burning; Arc Lamps; Regulating and Cut-Out Mechanism; Action of Current; Clutch Lamps; Clockwork Lamps; Double Lamps; Troubles in Lamps.—CHAPTER VII: Commutators and Brushes; The Brush Commutators; Brushes; Different Styles of Brushes; Double Brushes; Single Brushes; Troubles with Commutators and Brushes; Correct Position of Brushes; Sparking at Brushes; Care of Brushes and Commutators; Flashing.—CHAPTER VIII: Current Regulation; Hand Regulation; By Position of Brushes; Resistance Box; Resistance Coils.—CHAPTER IX: American System of Automatic Current Regulation; The Dynamo; Regulator; Action of Regulator.—CHAPTER X: Brush System of Automatic Current Regulation; Brush Armature; Diagram of Circuits through Dynamo, Regulator and Lamps; Dial or Regulator; Care and Adjustment of Dial; Dial Controller; Circuits and Connections of No. 8 Brush Dynamo; Circuits of Compound Wound Constant Potential Brush Dynamo.—CHAPTER XI: The Edison System; Automatic Regulator; Circuits of Regulator: Circuits of Dynamo; Action of Regulator; Howell Pressure Indicator; Diagram of Circuits; Description of Parts and Operation.—CHAPTER XII: Excelsior System of Automatic Current Regulation; Dynamo; Armature; Diagram of Circuits; The Regulator and Motor; Action of Regulator.—CHAPTER XIII: Schuyler System of Automatic Current Regulation; Dynamo; Armature, Commutator and Brushes; Diagram of Circuits in Armature and Field; Regulator; Circuits in Regulator.—CHAPTER XIV: Thomson-Houston System of Automatic Current Regulation; Dynamo; Armature; Commutator and Brushes; Controlling Magnet; Wall Controller; Diagram of Circuits; Air Blast.—CHAPTER XV: Waterhouse System of Three-Brush Automatic Current Regulation; Dynamo; Extra Brush; Resistance Coils and Regulator.—CHAPTER XVI: Ampere Meters; Tangential Scale; Solenoid Meters.—CHAPTER XVII: Voltmeters; Pressure and Potential Indicators.—CHAPTER XVIII: Testing; Galvanometers; Astatic Needle; Differential Apparatus.—CHAPTER XIX: Wheatstone Bridge or Electrical Balance; Diagram of Circuits and Methods of use; Bridge and Rheostat; Round Form; Square Form.—CHAPTER XX: The Magneto as a Testing Instrument; Armature; Field; Bell; Diagram of Circuits.—CHAPTER XXI: Coupling Dynamos Together; In Series; In Shunt; Series, Shunt and Compound Wound Machines.—CHAPTER XXII: Switches and Switchboards; Loop Switch; Plug and Socket; Change Over Plug and Socket; Conclusion.—CHAPTER XXIII: Electric Motors; General Principles the Same as in Dynamos; Types; Shunt and Series Motors Suitable for all General Purposes; Regulation of Shunt Motors; Of Series Motors; Counter E. M. F.; Direction of Rotation and Direction of Current; Starting Motors; Diagram of Connection.

**PART II. CONTENTS.**—CHAPTER I: Alternate Current Dynamos; Principles of the Field; Field Current Armature; Winding; Connections; Lamination; Different Types of Alternators; Regulation; Leading Systems; The Brush Generators; Magnets; Armature; Principles of Induction.—CHAPTER II: Dynamos, Continued; The Mordey Alternator; Stationary Armatures; Field Magnets; Ferranti Armatures; Field Magnets; Windings; Collectors.—CHAPTER III: Dynamos Concluded; Siemens Dynamo; Best Magnetic Circuits; Stanley Constant Current Dynamo; The Armature; Self Induction; Regulation.—CHAPTER IV: Induction Coils; Converters; Transformers; Economy of Distribution; An Electrical H. P.; Losses in Conductor; Induction Coils; Effect of Induction; Transformers.—CHAPTER V: Transformers Continued; Induction Coils; Converters; Transforming Up and Down; Design of Transformers; The Static Charge; Protection Against; Grounding the Secondary; Other Devices; The Foil Protector; Different Types of Transformers.—CHAPTER VI: Transformers, Concluded; Fuses; Regulation; Winding of Transformers; Connecting to Circuit; Regulation; Safety Fuses.—CHAPTER VII: Parallel System; Series Arc Light System; Diagram of Circuits; Parallel System; Primary Circuit; Secondary Circuit; Placing of Transformers; Fuses; Diagram of Series Arc Light Circuit.—CHAPTER VIII: Lines of Force; Hysteresis; Magnetic Penetration; The Circuit of Lines of Force; Experiments with Magnet; Rapidity of Reversals and Hysteresis.—CHAPTER IX: Arc Lamps; In Series; The Westinghouse Arc Lamp; Diagram of Circuits in Lamp; Action of the Mechanism; Flat Carbons.—CHAPTER X: Arc Lamps, in Multiple; Slattery Differential Lamp; Mechanism of Lamp; Its Operation.—CHAPTER XI: Measuring and Indicating Apparatus; Instruments for Use with Alternating Currents Differ from those used with Continuous Currents. Ammeters, Voltmeters; Description of Several Forms of Instruments.—CHAPTER XII: Measuring Instruments, Continued; Hot Wire Instruments; The Cardew Voltmeter; Details of the Instrument; Low Potential Voltmeter.—CHAPTER XIII: Voltmeters; Double Coil Voltmeter; Two Types.—CHAPTER XIV: Spring Meters, Curled Spring Meter.—CHAPTER XV: Twisted Strip Instruments; Diagram of Connections and Operation of Instrument.—CHAPTER XVI: Recording Meters; Stanley Meter; Construction and Principles of Operation; Diagrams of Parts; Slattery Induction Meter; Description of Parts and Principles of Operation; Watt Meter; Thomson Meter.—CHAPTER XVII: Generators in Parallel; Difficulties in Operating; Alternate Current Generators in Parallel; Arrangements of Circuits and Machines for Operating in Parallel; Diagram of Common Arrangement of Machines and Circuits.—CHAPTER XVIII: Ohm's Law; Strength of Current; Formulas and Examples; Power and Heating Effects of Currents.—CHAPTER XIX: Ground Alarms and Leak Detectors.

# In $ and ¢

the Automatic Telephone Exchange effects a large saving over the manually operated exchange and adds value and stability to the operating company's securities.

Among the cities in which it has been adopted are

| | |
|---|---|
| Chicago, Ill. | Augusta, Ga. |
| Grand Rapids, Mich. | Medford, Wis. |
| Columbus, Ohio | St. Mary's, Ohio |
| Dayton, Ohio | Woodstock, N. B. |
| Lincoln, Neb. | Westerly, R. I. |
| Portland, Maine | Manchester, Iowa |
| Auburn, N. Y. | Princeton, N. J. |
| Lewiston, Maine | Albuquerque, N. M. |
| Auburn, Maine | Van Wert, Ohio |
| Fall River, Mass. | Battle Creek, Mich. |
| New Bedford, Mass. | Clayton, Mo. |
| Los Angeles, Cal. | Pentwater, Mich. |
| San Diego, Cal. | Toronto J'ct'n, Can. |
| Hopkinsville, Ky. | Wilmington, Del. |
| Sioux City, Iowa | Riverside, Cal. |
| Cleburne, Tex. | Traverse City, Mich. |
| Columbus, Ga. | Berlin, Germany |

All this besides giving the ideal telephone service, prompt, accurate and secret. These points are the meat of the proposition. Consider them.

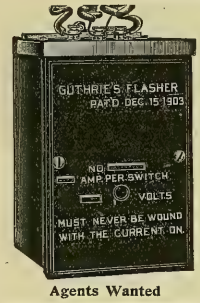
**ST. PAUL, - - MINN.**

## It Can't Be Beat—The Guthrie Flasher

A SIGN FLASHER WITHOUT A MOTOR



Agents Wanted

A FEW ADVANTAGES OF THIS FLASHER OVER ALL OTHERS:

*First.*—The Price is lower.
*Second.*—It has fewer parts and is therefore the simplest flasher on the market.
*Third.*—It has no motor to cause trouble and consume current.
*Fourth.*—It costs nothing to operate this flasher.
*Fifth.*—It only occupies a space of 5 x 8 inches.
*Sixth.*—It can be regulated to flash any signs or show window lights in any manner desired.
Any combination of lights, without motor or cylinder.
Simplest and best on the market.
Works on any current.
The disadvantage of a flasher was the motor question.
We have overcome this and are putting out an article that meets a long felt want.

**A. S. DOXSEE ELECTRICAL CO.**

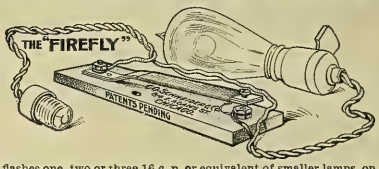
## A MOTORLESS FLASHER



Automatically flashes one, two or three 16 c. p. or equivalent of smaller lamps, on either direct or alternating current. Contacts are heavy platinum and will wear indefinitely. Requires no attention and has nothing to get out of order. PRICE $2.00 EACH. Write for discount to the trade.

**C. O. Schneider & Co., Mfrs. 84 E. Adams St., Chicago**

"Flexduct" is that high standard required in all high-class work. It is very flexible, a high insulation and indestructible

# FLEXIBLE CONDUIT

"Flexduct" the National Code Standard. It does not deteriorate, always usable to highest degree

**OSBURN FLEXIBLE CONDUIT COMPANY,**

NEW YORK CHICAGO SAN FRANCISCO

## Preeminently the Storage Battery

It costs no more than the Cell Type.
It has comparatively, considerably more active material and occupies less space (about half that required by Cell Type).
It is far more durable—is cleaner and more economical in operation and much less expensive in cost of maintenance.
Besides, this important fact must not be overlooked: There are no annoying and destructive fumes as with the Cell Type. The gas does not escape, therefore no corrosion of adjacent pipe or iron work or even the tarnishing of bright metal work.

**TRAY PLATE BATTERY CO.**
Successors Smith Storage Battery Co.

**MARION INSULATED WIRE & RUBBER COMPANY**
MARION, INDIANA CHICAGO, 529-530 Monadnock Block, I. A. Bennett, Mgr.

## CONSTANT USE OF THE C-H. FIELD REGULATOR HAS PROVEN

That the material of which its base is made does not allow grounding; that overloads do not disintegrate it; that it readily radiates and conducts heat, and is a perfect insulator. Its construction is such that no trouble can exist from small parts or contacts. Bulletin 32 explains in detail.

THE CUTLER-HAMMER MFG. CO.
MILWAUKEE, WIS.

# Keep Up With the Procession.

**Everyone engaged in the electrical business should keep posted on the developments in the art by reading the latest books on the subject. We are headquarters in the West for electrical books and can fill orders for any work published, promptly on receipt of price. We call your special attention to the following standard books:**

ALLSOP, F. C.—Electrical Bell Construction: Treatise on the Construction of Electric Bells, Indicators and similar apparatus. 177 illustrations.....$1.25

ATKINSON, PHILIP.—The Elements of Electric Lighting. Seventh edition, fully revised, and new matter added. 104 illustrations. 260 pages.....$1.50

ATKINSON, PHILIP.—The elements of Dynamic Electricity and Magnetism. 406 pages and 117 illustrations. Second edition .....$2.00

AYRTON, W. E.—Practical Electricity: a Laboratory and Lecture Course for First-year Students of Electrical Engineering. Based on the Practical Definitions of the Electrical Units. With numerous illustrations. Sixth edition .....$2.50

BADT, LIEUT F. B.—New Dynamo Tenders' Hand Book. This is, as the name indicates, a NEW BOOK, much more complete than the old one, with all the information, instructions and rules which are required by practical men, as Dynamo Tenders, Linemen, Stationary Engineers and owners and operators of all kinds of Electric Plants. It is the only book of the kind published in the English language. 226 pages, 140 illustrations, flexible cloth binding, size of type page 5½x3 inches .....$1.00

BADT, LIEUT. F. B.—Incandescent Wiring Hand Book. A timely book containing full illustrations for incandescent wiring and complete information concerning methods of running wires, location of safety devices, splices, insulation, testing for faults, wire gauges, general electrical data, calculating sizes of wires, wiring fixtures, elevators, buildings, isolated and central station plants. The only book of the kind published. Type page 5½x3 inches, flexible cloth binding, 66 pages, 35 cuts and 3 tables, 3 of which are 12x18 inches.....$1.00

BADT, LIEUT. F. B.—Bell Hangers' Hand Book. Just the book for people engaged in selling, installing or handling electric batteries, electric bells, elevators, house or hotel annunciators, burglar or fire alarms, electric gas lighting apparatus, electric heat apparatus. 106 pages, 97 illustrations, flexible cloth binding. Type page 5½x3 inches.....$1.00

BADT, LIEUT. F. B. A.—Electric Transmission Hand Book. First edition, 3,000 copies. 97 pages, 22 illustrations, 27 original tables.....$1.00

Gives more Practical information on the subject than any work published to date. The book contains all necessary information for Power Producers, Capitalists, Agents, Engineers and Motor Inspectors. With this book anybody may make estimates on the cost of Transmission Plants.

BEDELL, FRED'K AND ALBERT C. CREHORE.—Alternating Currents; An Analytical and Graphical Treatment for Students and Engineers. Second edition. 113 illustrations .....$2.50

BELL, LOUIS, PH. D.—The Art of Illumination. This is the only book in the language which deals directly with the scientific and artistic use of illuminants, electric and other. Cloth, 339 pages, 127 illustrations. Price .....$2.50

BONNEY, G. E.—Electro-Plater's Hand Book. A Manual for Amateurs and Students in Electro-Metallurgy. 60 illustrations, 208 pages. 12mo, cloth....$1.25

BOTTONE, S. R.—Electrical Instrument Making for Amateurs. A Practical Hand Book, with 48 illustrations. Fourth edition. Enlarged by a chapter on the Telephone .....$0.50

BOTTONE, S. R.—The Dynamo, How Made and How Used. A Book for Amateurs. Eighth edition, with additional matter and illustrations .....$1.00

BOTTONE, S. R.—Electro-Motors. How Made and How Used. A Hand Book for Amateurs and Practical Men. Reduced to .....$0.50

BUCKLEY, W. J.—Electric Lighting Plants, Their Cost and Operation. 275 pages, many illustrations and diagrams. Paper .....$1.00

CROCKER, F. B. AND WHEELER, S. S.—The Practical Management of Dynamos and Motors. With a special chapter by H. A. Foster. Illustrated. Second edition, revised and enlarged.....$1.00

CUSHING, H. C., JR.—Standard Wiring for Electric Light and Power. A compilation of formulæ, rules and requirements from the most modern practice, and in accordance with the rules and requirements of the Boston Fire Underwriters' Union, the New England Insurance Exchange, and as recommended by the Underwriters' International Electric Association. 12mo, leather .....$1.00

DESMOND, CHAS.—Electricity for Engineers. Part I. Constant Current. A clear and comprehensive treatise on the principles, construction and operation of Dynamos, Motors, Lamps, Indicator and Measuring Instruments also a full explanation of the electrical terms used in the work. Part II. Alternate Current Apparatus. Containing an explanation of the principles governing the generation of, and a description of the instruments and machinery used in connection with, Alternate Electric Currents. Illustrated. Revised edition .....$2.50

DOBBS, A. E.—The Inspector and Trouble Man. A practical book, written in plain language. Full of information and diagrams for the operator, exchange manager, inspector, trouble man and lineman. A complete description of telephones, how to find and remedy their troubles, together with working plans for exchange construction, complete with diagrams of all up-to-date telephones and switchboards. 106 pages. Price...$1.00

DYER, A.—Induction Coils, How Made and How Used. Third edition. Boards .....$0.50

FLEMING, J. A.—Short Lectures to Electrical Artisans. A course of Experimental Lectures delivered to a Practical Audience. Fourth edition. 74 illustrations..$1.50

FLEMING, J. A.—The Alternate Current Transformer in Theory and Practice. Vol. I: The Induction of Electric Currents. 500 pages, fully illustrated and with copious index. Second edition .....$3.00

Synopsis of contents: Chapter 1. Introductory. 2. Electro-Magnetic Induction. 3. The Theory of Simple Periodic Currents. 4. Mutual and Self Induction. 5. Dynamical Theory of Current Induction.

Vol. II. The Utilization of Induced Currents. 8vo, cloth. London, 1892 .....$5.00

GAYETTY, J. W.—Motorman's Guide. A Practical Treatise on Street Railway Motors. Illustrations and diagrams. Cloth .....$0.50

GORDON.—School Electricity. Sources, Currents, Measurement, Telegraphy, Telephony, Lightning, Electrolysis, Induction, etc. 262 pages, with 140 illustrations..$2.00

GORE, G.—The Art of Electro-Metallurgy, including all Known Processes of Electro Deposition. Fourth edition .....$2.00

GRIER, THOS. G.—Wiring for Motor Circuits. A handy little pamphlet containing tables for wiring and for motor service, arranged in convenient form for ready reference .....$1.00

HASKINS, C. C.—Electricity Made Simple. 233 pages, 108 illustrations. Paper covers.....$0.50

A valuable, non-technical work for those whose opportunities for gaining information on the branches treated have been limited.

HASKINS, C. H.—The Galvanometer and Its Uses. A Manual for Electricians and Students. Fourth edition; revised .....$1.50

HASKINS.—Transformers. Their Theory, Construction and Application Simplified. 38 illustrations.....$1.25

HAWKINS, C. C. AND F. WALLIS.—The Dynamo, Its Theory, Design and Manufacture. 190 illustrations.$3.00

HAWKINS, N.—New Catechism of Electricity. A Practical Treatise Relating to the Dynamo and Motor, Wiring, the Electric Railway, Bell Fitting, etc., etc. Red leather, pocketbook form. 93 illustrations....$2.00

HOMANS, J. E., A. M.—A, B, C OF THE TELEPHONE. 352 pages, 269 illustrations. Price.....$1.00

Owing to the demand for a comprehensive book giving a clear, terse idea of the principles governing the construction, installation, care and management of telephones and their appliances, this book has been compiled. It has been the aim of the author to make this the most complete elementary book on this subject for the practical electrician, wireman, lineman and engineer, and it is written in a clear and careful style.

HOPKINS, GEO. M.—Experimental Science. Elementary, Practical and Experimental Physics. 650 illustrations .....$4.00

HOPKINSON.—Original Papers on Dynamo Machinery and Allied Subjects. Illustrated.....$1.00

HOPKINSON, DR. JOHN.—Dynamic Electricity; Its Modern Use and Measurements, Chiefly in Its Application to Electric Lighting and Telegraphy.....$0.50

HORSTMANN, H. C. AND VICTOR H. TOUSLEY.—Modern Wiring Diagrams and Descriptions. A Hand Book of Practical Diagrams and Information for Electrical Workers. 160 pages, over 200 illustrations. Full leather binding, pocket size 4x6.....$1.50

HOSPITALIER, E.—Domestic Electricity for Amateurs; Translated from the French, with additions by C. J. Wharton. With illustrations.....$2.50

HOUSTON, EDWIN J.—A Dictionary of Electrical Words, Terms and Phrases. Fourth edition, greatly enlarged, with over 6,000 additional words and definitions. 2 volumes, 1,000 pages.....$6.00

KAPP, GISBERT.—Electric Transmission of Energy and Its Transformation, Subdivision and Distribution. A practical hand book. Fourth edition.....$3.00

KAPP, GISBERT.—Alternate Current Machinery. Illustrated .....$0.50

(Vol. 96. Van Nostrand's Science Series.)

KAPP, GISBERT.—Dynamos, Alternators and Transformers. 138 illustrations.....$4.00

KEMPE, H. R.—A Hand Book of Electrical Testing. Fifth edition. 200 illustrations. 8vo, cloth. London 1892 .....$7.25

In this edition there is a considerable amount of new matter; the old matter has been thoroughly revised.

KEMPE, H. R.—The Electrical Engineer's Pocket Book. Modern Rules, Formulæ, Tables, and Data. 32mo, leather .....$1.75

LOCKWOOD, T. D.—Electricity, Magnetism and Electric Telegraphy. A Practical Guide and Hand Book of General Information for Electrical Students, Operators and Inspectors. 376 pages, 152 illustrations.....$2.50

LOCKWOOD, T. D.—Electrical Measurement and the Galvanometer; Its Construction and Use. Second edition .....$1.50

LYNDON, L.—Storage Battery Engineering. A Practical Treatise for Engineers. This is a practical work, intended for the electrical engineer who is called on to design and install storage battery equipments, or who has a battery power plant under his care. Cloth. 360 pages, 178 illustrations and diagrams, 4 large folding plates. Price .....$3.00

MEADOWCROFT, W. H.—The A, B, C of Electricity. 36 illustrations. 12mo, cloth. New York.....$0.50

MAYER AND DAVIS, M. M.—The Quadruplex. With Chapters on the Dynamo-Electric Machine in Relation to the Quadruplex. The Practical Working of the Duplex Telegraph Repeaters and the Wheatstone Automatic Telegraph. 63 illustrations.....$1.50

MEYER, HENRY, C., JR., M. E.—Steam Power Plants. Their Design and Construction. Cloth. 163 pages, 63 illustrations, 15 folding plates. Price.....$2.00

MILLER, KEMPSTER B.—American Telephone Practice. 518 large octavo pages, 379 illustrations.....$3.00

This book treats of the subject in a simple and comprehensive manner from the practical standpoint, and almost entirely without the use of mathematics.

NOLL, AUGUSTUS.—How to Wire Buildings. A manual of the art of interior wiring. Illustrated.....$1.50

POPE, FRANKLIN LEONARD.—Modern Practice of the Electric Telegraph. A technical hand book for Electricians, Managers and Operators. 185 illustrations. Fourteenth edition, rewritten and enlarged.....$1.50

PRINDLE, H. B.—A Popular Treatise on the Electric Railway of To-day. Fully illustrated.....$0.25

REED, LIEUMAN C.—American Meter Practice. This is the only American book dealing with the theory and practice of current metering. Cloth. About 250 pages, illustrated. Price .....$2.00

RUSSELL, STUART A.—Electric Light Cables and Distribution of Electricity. 107 illustrations.....$2.25

SALOMONS, SIR DAVID.—Electric Light Installations. Vol. 1. The Management of Accumulators. A Practical Hand Book. Seventh edition, revised and enlarged. With illustrations. 12mo. cl. London, 1893.....$1.50

SLOANE, T. O'CONNOR.—Electricity Simplified. The Practice and Theory of Electricity, including a Popular Review of the Theory of Electricity, with Analogies and Examples of Its Practical Application in every day life. Illustrated .....$1.00

SLOANE, T. O'CONNOR.—The Standard Electrical Dictionary. A popular dictionary of words and terms used in the practice of electrical engineering. 350 illustrations .....$3.00

SLOANE, T. O'CONNOR.—Electric Toy Making for Amateurs, including Batteries, Magnets, Motors, Miscellaneous Toys .....$1.00

SLOANE, T. O'CONNOR.—The Arithmetic of Electricity. A Manual of Electrical Calculations by Arithmetical Methods, including numerous rules, examples and tables for the field of electrical engineering and experimenting. Third edition, revised.....$1.00

STEVENS, H. G.—Mechanical Catechism. For Stationary and Marine Engineers, Firemen, Electricians, Motormen, Ice Machine Men and Mechanical Students. 336 pages, over 240 illustrations. Cloth.....$1.00

THOMPSON, SYLVANUS P.—Dynamo-Electric Machinery. A series of lectures, with an introduction by Franklin L. Pope. 146mo. Numerous illustrations, fancy boards (Van Nostrand's Science Series, No. 66).....$0.50

THOMPSON, SYLVANUS P.—Polyphase Electric Currents and Alternate-Current Motors. Mailed to any address in the world on receipt of.....$3.50

THOMPSON, SYLVANUS P.—Recent Progress in Dynamo-Electric Machines, being a Supplement to Dynamo-Electric Machinery. 16mo. (Van Nostrand's Science Series, No. 75).....$0.50

Office and Factory: PAWTUCKET, R. I.

We have never posed as prophets. We do not claim to possess the sense of second sight. Our feet are guided by the lamp of experience. We judge the future by the past. We have always been of opinion that the same causes under the same conditions would produce the same effects.

Believing in the law of cause and effect, and judging the future by the past, we are able accurately to foresee and foretell what will result from an aggressive and intelligent advertising campaign. We know absolutely that the right kind of advertising in the right mediums will bring right results. We know that spasmodic advertising of an indifferent character will bring unsatisfactory results. And we know that in 100 cases out of 100 the man who thinks he can do business without using printer's ink will sooner or later—and generally sooner—be compelled to close his doors permanently and be numbered among the financial failures.

The Western Electrician is the only general electrical paper published in the West. It thoroughly covers a territory peculiarly and exclusively its own. Purchasers and possible purchasers of electrical goods can be reached through its columns.

Do you wish to reach them?

**WANTED, FOR SALE** *and similar* **WANT COLUMN** *advertisements (50 words or less), $1.50 an insertion; additional words 3c each.* **POSITION WANTED** *advertisements (50 words or less), $1.00 an insertion; additional words 2c each.*

## POSITION WANTED.

To take charge of line department of an electric light and power plant; eight years' practical experience in both alternating and direct current, installing transformers, meters, motors, also am a good inside wireman. Address BOX 452, care of Western Electrician, 510 Marquette Bldg. Chicago.

## WANTED.

Electrician.—A first-class, up-to-date and energetic man, capable of taking foremanship in repair shop; must be familiar with all branches of armature and field windings and machine work in connection with electrical repair work in general; only those qualified to fill the above position need apply. Address, stating full particulars, to Graham Bros. Co., 662 Hudson St., New York City.

## WANTED.

Chicago corporation of sound financial standing, manufacturing one staple electrical line, desires western representation of one good eastern manufacturer. We have strong sales organization, influential connections in the electrical business, central location with ample storage and shipping facilities. We can build up a western business for a first-class product. Address, BOX 450, care Western Electrician, 510 Marquette Building, Chicago.

## WANTED.

Traveling salesmen. One to travel in the states of Colorado, Arizona and New Mexico and Old Mexico. Two for other territories. Must be thoroughly acquainted with the electrical supply business and have a knowledge of electrical apparatus and telephone supplies. Men who have had road experience selling supplies preferred. Will pay first-class salaries to the right men. Applications must be accompanied with references. Address Box 451, care Western Electrician, 510 Marquette building Chicago, Ill.

## FOR SALE.

## BURGER
## AUTOMATIC GAS ENGINE

The only strictly automatic cut-off Gas Engine in the world. For electric work unsurpassed, giving regulation unequaled by any steam engine. Adapted to use any fuel with the best satisfaction and the greatest economy, producing one H. P. per hour on one lb. of coal. For a money saver power users should investigate.

Correspondence solicited.

Mechanical Perfection

*FREE ON REQUEST. SEND FOR IT.*

JOSEPH DIXON CRUCIBLE CO., Jersey City, N. J.

FIBRE-GRAPHITE COMMUTATOR BRUSH — SELF-LUBRICATING — NOISELESS

## There's No Friction

with the Fibre-Graphite Commutator Brush. Being 90 per cent. pure graphite, it insures low resistance, no sparking under a varying load, and longer wear. There is no greasing required. The Fibre-Graphite is therefore the most economic brush on the market. Send for price list.

HOLMES FIBRE-GRAPHITE MFG. CO.
5155 Wakefield St., Germantown, PHILADELPHIA.

## SINGLE-PHASE MOTORS

THAT WILL START UNDER FULL LOAD IS OUR SPECIALTY.

No delicate starting devices such as condensors, phase coils and clutches are used.

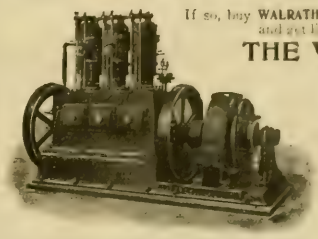
CENTURY ELECT. CO.,
404 N. 4th St.,
ST. LOUIS, MO.

## JEFFREY CHAIN BUCKET DREDGES

FOR CATALOGUE, ADDRESS THE JEFFREY MFG. CO. COLUMBUS, OHIO.

## ARE YOU LOOKING FOR MONEY?

If so, buy WALRATH GAS OR GASOLINE ENGINES and get light on the subject.



## THE WALRATH

Received the Highest Award at the Pan-American Exposition.

It will produce as good a commercial test as that of an automatic steam engine, either belted or direct connected generator. Simple, Economical and Reliable. Send for Catalogue W

# SPRINGJACK PATENTS SUSTAINED

Pursuant to opinion of the United States Circuit Court of appeals for the Sixth Circuit, rendered January 3, 1905, a final decree was entered February 27, 1905, in the case of Western Electric Company, complainant, against The North Electric Company of Cleveland, Ohio, and others, defendants, holding Scribner patents Nos. 357,538 and 552,729, and Scribner & Warner patent No. 488,033 valid and infringed, the defendant company paying a substantial sum as profits and damages, in addition to court costs. An injunction has been issued against the North Electric Company restraining further infringement.

The public is advised that the rights of the Western Electric Company under these patents will be enforced against infringers.

## CONSTANT USE OF THE C-H. FIELD REGULATOR HAS PROVEN

That the material of which its base is made does not allow grounding; that overloads do not disintegrate it; that it readily radiates and conducts heat, and is a perfect insulator. Its construction is such that no trouble can exist from small parts or contacts. Bulletin 32 explains in detail.

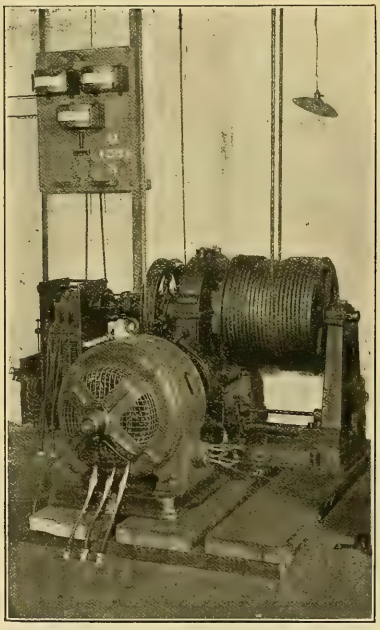
# ANNOUNCEMENT

## A SINGLE-PHASE ELEVATOR MOTOR

After many years of continuous experimental work and diligent observations of all important motor improvements in this country and abroad, we are finally able to announce the development of a PERFECT SINGLE-PHASE POWER MOTOR for Elevator and Hoist Work. This new motor promises all the advantageous torque, current and other performance characteristics of the best direct-current motors for the same class of service, and we invite immediate correspondence looking to the installation of such equipments as you may require.

We are prepared to supply on short notice motors of 10 H. P. or less capacity, for 60-cycle service, and will shortly be prepared to deliver units of 25 H. P. capacity or less for this and other frequencies.

Write for circulars and prices.



We are prepared to undertake the adaptation of this form of motor at once to the following kinds of service:

ELEVATORS
(Rope control, direct coupled or belted.)

HOISTS
of all kinds.

TRAVELING CRANES

VARIABLE SPEED DRIVE
Where 40 per cent speed regulation will be satisfactory.

Mechanical Appliance Co.
Milwaukee, Wis.

It takes the continuous, follow-up pounding of a pile driver to drive a pole into the ground.

A man on the road seldom gets an order the first time he calls. The order comes as the result of repeated calls.

An inquiry is an indication that the inquirer is interested, and may purchase sooner or later. The mere sending of a catalog in response to an inquiry seldom consummates a sale.

The inquiry must be followed up.

The concerns that get the business follow up inquiries persistently and systematically.

Continuous advertising in the right mediums familiarizes the possible purchaser with the name and address and merits of the product of the advertiser.

It paves the way for the man on the road and makes his work easier and more effective. It brings inquiries which are or should be followed up by mail or by personal calls.

In some cases it creates a demand for an article where none existed before.

If your first ad fails to secure an inquiry; if your first letter in reply to an inquiry fails to secure an order; or if you fail to get it at the time of the first personal call—try, try again.

Advertising in the Western Electrician will bring the inquiries.

**WANTED, FOR SALE** *and similar* **WANT COLUMN** *advertisements (50 words or less), $1.50 an insertion; additional words 3c each.* **POSITION WANTED** *advertisements (50 words or less), $1.00 an insertion; additional words 2c each.*

# The Inspector AND Trouble Man.

## By A. E. DOBBS.

Full of information and diagrams for the operator, exchange owner, exchange manager, inspector, trouble man, lineman.

A complete description of telephones and their troubles. How to find and remedy them, together with working plans for exchange construction, complete with diagrams of all up-to-date telephones and switchboards.

This is a practical book, written in **plain language,** and for **anyone** interested in telephony.

**Mailed anywhere on receipt of price . . .** **ONE DOLLAR.**

No technicalities. Substantially bound in cloth.

**ELECTRICIAN PUBLISHING CO.,**
**510 MARQUETTE BUILDING, CHICAGO.**

# Worth Having!

# STEVENS' MECHANICAL CATECHISM

## PRACTICAL KNOWLEDGE

FOR

**Stationary and Marine Engineers, Firemen, Electricians, Motormen, Ice Machine Men and Mechanics in General.**

New and Original. All Modern Machinery fully described and explained. Technical Points made Clear by Word and Drawing. Questions and Answers for Civil Service Examinations, etc.

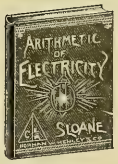
## SUBJECTS TREATED:

WATER, STEAM, COMBUSTION, SMOKE PREVENTION, BOILERS, BOILER CONSTRUCTION, TESTING AND MANAGEMENT, SAFETY VALVES, INJECTORS, PUMPS AND GOVERNORS, STEAM GAUGES, LUBRICATORS, ENGINES, COMMON SLIDE VALVE, TANDEM COMPOUND, CROSS COMPOUND, RECEIVER ENGINES, HOT AIR AND COMPRESSED AIR ENGINES, TRACTION ENGINES, ELECTRIC ENGINES, AUTOMATIC AND CORLISS ENGINES, CONDENSERS, JET AND SURFACE, ECCENTRIC, BALANCED SLIDE VALVE, LINK MOTION, HORSE POWERS IN DETAIL, INDICATOR, REFRIGERATION, ABSORPTION AND COMPRESSION METHODS, BRINE AND DIRECT EXPANSION SYSTEMS, PUMPS, VALVES, TESTS, TABLES, AMMONIA, AMMONIA FITTINGS, LIQUID AIR, MACHINE SHOP PRACTICE, STANDARD NUMBERS AND RULES, PULLEY SPEED CALCULATION, SQUARE ROOT, LEVERAGE, ELECTRICITY, DYNAMOS, ACCUMULATOR, RHEOSTAT, TRANSFORMER, VARIETIES OF DYNAMOS, PARALLEL AND SERIES WIRING, THREE-WIRE SYSTEM, MANAGEMENT AND CARE OF ELECTRIC PLANT, REPAIRS, ELECTRICAL MEASUREMENTS, MOTORS, STATIONARY, TROLLEY AND THIRD RAIL SYSTEMS, CONTROLLER, ELECTRIC LOCOMOTIVE, ELECTRIC HEATING AND COOKING, HOUSE WIRING, DIFFERENTIAL GEAR, FRICTION CLUTCH, COMPOUND CYLINDERS, REVERSING GEAR, THE STACKER. ALSO, THE ELEMENTS OF ALGEBRA MADE EASY.

**336 Pages. 240 Illustrations.**

**PRICE, $1.00.** Sent anywhere prepaid on receipt of price.

**ELECTRICIAN PUBLISHING COMPANY,**
**510 Marquette Bldg., Chicago.**



Tenth Edition. Just Published.

## ELECTRICITY SIMPLIFIED

By PROF. T. O'CONOR SLOANE

158 Pages. Fully Illustrated. PRICE, $1.00

**Contents**

CHAPTER I. The Ether; Electricity; Force and Energy; Mass and Weight. CHAPTER II. The Electric Charge; Potential; The Dielectric; Positive and Negative Electricity; Contact Action; Electrostatic Lines of Force; The Leyden Jar.

CHAPTER III. The Electric Current and Circuit; Relations of Electromotive Force, Resistance and Current; Velocity of Electricity.

CHAPTER IV. Fundamental Units and the Relations Between Electrostatic and Electromagnetic Units; Practical Units; the Volt, Ohm, Coulomb and Ampere; Electric Force, Work and Energy; Chemistry of the Current.

CHAPTER V. The Magnetic Circuit and Electromagnetic Lines of Force; Magnet and Ampere's Theory.

CHAPTER VI. Electromagnetic Induction and Action of Currents Upon Each Other; The Induction Coil and its Application.

CHAPTER VII. The Galvanic Battery; The Electrotype and the Locus of its Potential Difference; Polarization and Local Action; Different Examples of Batteries; The Arrangement and Action of Batteries; Storage Batteries.

CHAPTER VIII. Dynamos; Motors; Transmission of Power.

CHAPTER IX. The Telephone and Microphone; Electric Lighting; The Electric Telegraph; The Dangers of Electricity; Conditions for receiving a Fatal Shock.

Sixteenth Edition. Just Published.

## ARITHMETIC of ELECTRICITY

By PROF. T. O'CONOR SLOANE

168 Pages. Illustrated. PRICE, $1.00

**Contents**

CHAPTER I. Introductory. CHAPTER II. Ohm's Law. CHAPTER III. Resistance and Conductance. CHAPTER IV. Potential Difference. CHAPTER V. Circular Mills. CHAPTER VI. Special Systems. CHAPTER VII. Work and Energy. CHAPTER VIII. Batteries. CHAPTER IX. Electro-Magnets, Dynamos and Motors. CHAPTER X. Demonstration of Rules. CHAPTER XI. Notation in Power of Ten. Tables.

## Standard Electrical Dictionary

By PROF. T. O'CONOR SLOANE

682 Pages. 393 Illustrations. PRICE, $3.00

**An Entirely New Edition, Brought Up To Date and Greatly Enlarged. Complete—Concise—Convenient.**

A practical handbook of reference, containing definitions of about 5,000 distinct words, terms and phrases.

The work is absolutely indispensable to all in anyway interested in electrical science, from the higher electrical expert to the everyday electrical workman. In fact it should be in the possession of all who desire to keep abreast with the progress of this branch of science.

Fifteenth Edition. Just Published.

## ELECTRIC TOY MAKING

**DYNAMO BUILDING and ELECTRIC MOTOR CONSTRUCTION**

By PROF. T. O'CONOR SLOANE

185 Pages. Very Fully Illustrated. PRICE, $1.00.

**Contents**

CHAPTER I. Batteries. CHAPTER II. Permanent Magnets. CHAPTER III. Electro-Magnets. CHAPTER IV. Electric Motors. CHAPTER V. Electric Bells. CHAPTER VI. Miscellaneous Toys. CHAPTER VII. Spark and Induction Coils, and Allied Subjects. CHAPTER VIII. Hand-Power Dynamo. CHAPTER IX. Miscellaneous Receipts and Formulæ.

Twelfth Edition. Just Published.

## How to Become a Successful ELECTRICIAN

By PROF. T. O'CONOR SLOANE

200 Pages. Illustrated. PRICE, $1.00

**Contents**

CHAPTER I. Introductory. CHAPTER II. Mathematics CHAPTER III. Physics. CHAPTER IV. Chemistry CHAPTER V. Electricity at Home. CHAPTER VI. Mechanical Engineering. CHAPTER VII. Drawing. CHAPTER VIII. Teachers. CHAPTER IX. Electrical Factory Work for Students. CHAPTER X. College Education. CHAPTER XI. Steam Engineering CHAPTER XII. The Manufacturing Engineer. CHAPTER XIII. The Constructing Engineer. CHAPTER XIV. The Station Engineer. CHAPTER X . Inventing. CHAPTER XVI. Original Investigation. CHAPTER XVII Succes CHAPTER XVIII. Reading. CHAPTER XIX. Ethics.

# IMPORTANT TELEPHONE BOOKS.

THE TELEPHONE HANDBOOK. By Herbert Laws Webb. 16mo, 150 pp. Price $1.00.
This handbook is a reliable treatise on telephony, and a practical book on telephone working and management, based entirely on standard American practice. It is extremely useful to telephone inspectors and operators.

AMERICAN TELEPHONE PRACTICE. By Kempster B. Miller, M. E. 510 pp. 380 illustrations. Price $3.00.
This is the first complete treatise on telephony in the English language. The text is profusely illustrated by cuts of commercial apparatus and carefully prepared diagrams of circuits. No diagram is given without a full explanation. The apparatus, circuits and methods of the American Bell Telephone Company and of the various independent companies are fully described. The apparatus and methods used in making all of the tests required in commercial telephone work are fully treated.

THE INSPECTOR AND TROUBLE MAN. By A. E. Dobbs. 106 pp. Price $1.00.
A practical book, written in plain language. Full of information and diagrams for the operator, exchange manager, inspector, trouble man and lineman. A complete description of telephones, how to find and remedy their troubles, together with working plans for exchange construction, complete with diagrams of all up-to-date telephones and switchboards.

A, B, C, OF THE TELEPHONE. By J. E. Homans, A. M. 352 pp. 269 illustrations. Price $1.00.
Owing to the demand for a comprehensive book giving a clear, terse idea of the principles governing the construction, installation, care and management of telephones and their appliances, this book has been compiled. It has been the aim of the author to make this the most complete elementary book on the subject for the practical electrician, wireman, lineman and engineer, and it is written in a clear and careful style.

THE PRACTICAL TELEPHONE HANDBOOK. By Joseph Poole, A. I. E. E. Second edition, revised and enlarged. 360 pp. 288 illustrations. Price $1.50.
In this work the writer has endeavored to produce a manual of moderate size and cost, but thoroughly practical, and detailing, as far as space will allow, the most recent methods of telephone working. While the requirements of telephone employes have been kept constantly in view it is fully intended also that the book shall be of service as a source of information on telephonic matters to users of the telephone and to the public generally.

PRACTICAL FEATURES OF TELEPHONE WORK. By A. E. Dobbs. 134 pp. Price 75 cents.
A simple, plain-speaking handbook for the practical telephone man.

TELEPHONE TROUBLES AND HOW TO FIND THEM. A complete handbook for telephone inspectors. By W. Hyde and J. H. McManaman, edited by Prof. C. H. Haskins. Eighth edition. 16mo, 48 pp. Price 25 cents.
This little volume is an extremely practical work for telephone employes, written in a popular style and devoid of technicalities.

TELEPHONE LINES AND THEIR PROPERTIES. By Wm. J. Hopkins. Sixth edition. 272 pp. Illustrated. Price $1.50.

A MANUAL OF TELEPHONY. A new and large edition. By W. H. Preece, F. R. S., and A. J. Stubbs. 508 pp. 333 illustrations. Price $4.50.

TELEPHONES, THEIR CONSTRUCTION AND FITTING. A Practical Manual on the Fitting Up and Maintenance of Telephone and Auxiliary Apparatus. By F. C. Allsop. 191 pp. 168 illustrations. Price $1.25.

PATENTED TELEPHONY. A Review of the Patents Pertaining to Telephones and Telephonic Apparatus. Published by the American Electrical Engineering Association Cloth bound; fully illustrated. Price, $1.50.

THE ELECTRIC TELEPHONE. By E. J. Houston, Ph. D., and A. E. Kennelly, Sc. D.; 12mo, cloth, 422 pp., 142 illustrations. Price $1.00.

HOW TO MAKE AND USE THE TELEPHONE. By Geo. H Cary. 136 pp.; illustrated. Price $1.00.

**The Above, or Any Other Electrical Work Published, Sent on Receipt of Price.**

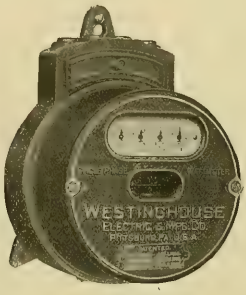
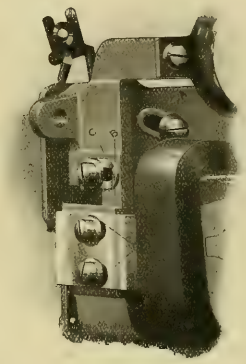
# The Westinghouse Type "B" Integrating Wattmeter



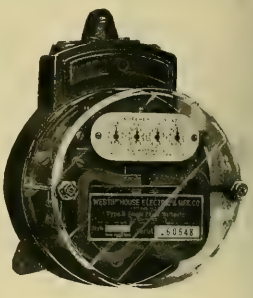
## Is Permanently Accurate

The accompanying illustration shows the adjustments (see letters A. B. C. D). There are no soldered adjustments as in other instruments, with danger of damage from acid fumes, they are all sliding, secured by set screws, which are readily accessible by removing the cover.



Type B Integrating Wattmeter. Adjustments

The moving element is the lightest on the market (15 grams) giving a minimum amount of weight upon the bearings. In addition it is provided with a ball bearing at the lower end of the shaft, reducing friction to the lowest possible degree.



## Is Easy to Adjust

Write for Folder 4047

# FORT WAYNE ELECTRIC WORKS

"WOOD" LIGHTING AND POWER SYSTEMS

## FORM C "WOOD" ARC LAMPS

are

**Easy to trim**
**Easy to adjust**
**Easy to repair**
**Easy to sell**
**Easy to buy**

A single lifting twist of the wrist releases globe or case

A single shifting of two clamps does the adjusting

Repairs are rarely necessary because the lamps are made for years of service—not for one season only.

Their selling qualities begin to talk as soon as the lamps are seen, and do not vanish with hard usage. And to buy them is quite as easy as to sell them. Write the home office and learn more.

Main Office and Factory—FORT WAYNE, IND.

# CARHARTT OVERALL FACTORY MADE CO-OP-

***Hamilton Carhartt, Manufacturer, (Incorporated,) One of the Strongest and Most Prosperous American Industrial Institutions, Offers to take into Partnership in his Business, his Employees, his Agents and the Men who Wear his Goods.***

## Send for Prospectus and Option Certificate.

Stock in Hamilton Carhartt, Manufacturer, (Incorporated), of Detroit, Michigan, preferred for 7% is offered to his Employees, Agents and the men who wear his goods.

**Details.** The capitalization of Hamilton Carhartt, Manufacturer, (incorporated), is $500,000. Of this, two-thirds is common stock owned by Mr. Carhartt. One-third is preferred stock for 7% and is now being sold to interested parties at par, $10 per share. Under the laws governing corporations, Mr. Carhartt cannot receive a dollar in dividends from the Company until preferred stockholders have been paid their 7% dividends.

**Reasons.** This is now the greatest business of its kind in the world, and Mr. Carhartt naturally desires that it so remain for an indefinite period. Therefore, it has been necessary to incorporate the business in order to insure its perpetuation, and at the same time carry out Mr. Carhartt's idea of taking into partnership those who have helped him build up his gigantic business. In this manner the organization will become a stable, corporate entity, unaffected by individual changes. In this manner the ability, capital and experience of many widely differing classes of people will be available—yet all will be bound together by the common purpose of increasing the power and prestige of this business. Experience has shown that this is the only method of insuring the permanency and rapid growth of a commercial institution manufacturing an article of universal consumption.

**Security.** The entire capitalization of the preferred stock is more than covering by actual, tangible assets —real estate, plant, equipment, stock, etc. Leaving the business of the Company altogether out of consideration, the stockholder is absolutely protected against loss by the property of the Company upon which preferred stock is by law in the position of a first mortgage after indebtedness is paid.

**Dividends.** The 7% dividends upon the preferred stock cannot fail to be paid even in times of financial stringency. For fifteen years this business has not failed to pay more than 7% on the entire capital involved, and the business is increasing and becoming more profitable every day, becoming stronger and stronger in its position as the merits of the Hamilton Carhartt Overalls become known, and this increasing prosperity Mr. Carhartt is willing to share with those who have helped him.

**Large Profits.** We feel this preferred stock is as safe as any investment in America, but at the same time it pays double the dividends of other investments of similar soundness. The savings bank is no better, and savings banks pay but 3 or 3½%. Remember that this stock, although offered at par is, on the basis of actual earnings, worth a great deal more, and will increase in value.

**Investigation.** The affairs of this Company, its books and records, are open to the investigation of the prospective purchaser of this stock. Nothing is hidden and nothing is left unexplained. The investor may satisfy himself thoroughly upon every possible point, and will have the full and cheerful assistance of this Company in so doing

**Promptness.** As this stock not only represents safety, but large dividends, it will be very attractive to the shrewdest investors, and it is difficult to say how long the opportunity to purchase will remain open. Promptness is, therefore, necessary The matter should not be deferred.

**Option.** By filling out the attached coupon, stating the number of shares desired, and giving name and address, the Company will grant an option of thirty days and forward a certificate to that effect This will give time for thought and investigation No obligation is incurred by the coupon or the certificate

**Prospectus of the Company explains all these matters in detail. Write for it, and read it.**

**Address for prospectus, option certificate, and full information, and send subscriptions and certified checks to**

**Hamilton Carhartt, Manufacturer,**
(INCORPORATED.)
DETROIT, MICHIGAN, U. S. A.

(COUPON.)
Hamilton Carhartt, Manufacturer, Inc.,

**HUGO REISINGER, Sole Importer, 11 BROADWAY, NEW YORK**

## Preeminently the Storage Battery

It costs no more than the Cell Type.

It has comparatively, considerably more active material and occupies less space (about half that required by Cell Type).

It is far more durable—is cleaner and more economical in operation and much less expensive in cost of maintenance.

Besides, this important fact must not be overlooked: There are no annoying and destructive fumes as with the Cell Type. The gas does not escape, therefore no corrosion of adjacent pipe or iron work or even the tarnishing of bright metal work.

## "99" Reasons why you should use the

# "FEMCO" Incandescent Lamp

1. Highest quality.
2. Highest average of candle power.
3. Intelligent selection of voltages.
4. Uniform efficiency.
5. Thorough factory tests.
6. Economical consumption of current.
7. Prompt shipments.
8. Prices lowest consistent with standard lamps.

The other ninety-one reasons you will easily discover by a trial of the lamp itself. Once you use "FEMCO" you will never be satisfied with any other. If you want the best of everything in a lamp, you must use the "FEMCO."

MADE BY THE MOST SKILLED WORKMEN

STANDARD ELECTRICAL MFG. COMPANY, : Niles, Ohio.

**Security Cable Distributing Panels**

**Are Safe and Handy and Cheap**

THESE are suitable for use in any ordinary pole box, or can be placed on the walls of an exchange or elsewhere, as may be desired. They are generally used in pairs. The panels are oak, highly finished, with a front of hard rubber on which the contacts are mounted. The cables may enter from below or from above and the copper wires will spread to the inner rows of contacts on both sides. The connection is made by a screw, threaded into metal and provided with a washer. This joint should of course be soldered permanently. The spider wires attach to the outer rows of contacts and are connected in the same way and should also be soldered. By so doing permanent results are reached, which is not the case in boards where there are no washers nor solder and where the screws go into wood instead of into metal. These boards can be used for metallic circuits or grounded or common return. There is nothing made which is so compact, convenient nor as economical. An electrician can make a good part of the price in the time he will save in first connecting the cables, not counting the subsequent convenience of making cross-connections, should they be desired.

Prices, including fuses of any amperage from ½ to 5, **10c per conductor, or 20c per pair.** A discount of 5 per cent. on orders of 750 or more conductors.

***RUNZEL-LENZ ELECTRIC MFG. COMPANY***
*97-101 So. Clinton St.* *CHICAGO, ILL.*

The name of the immediate predecessor of the last governor of your state appeared in every issue of every paper in the state for many weeks prior to his election, and frequently during the time he occupied the gubernatorial chair.

What was his name?

What was the name of his chief opponent for the office?

One swallow does not make a summer.

One ad does not constitute an advertising campaign.

If those who read ads had better memories, advertising appropriations could be materially reduced.

But the average man forgets.

Talking to him on the same subject 52 times a year will, however, burn it into his memory.

He could not forget if he would.

By running your ad in every issue of the Western Electrician you can compel its readers to remember who you are, where you are and what you make.

**WANTED, FOR SALE** *and similar* **WANT COLUMN** *advertisements (50 words or less), $1.50 an insertion; additional words 3c each.* **POSITION WANTED** *advertisements (50 words or less), $1.00 an insertion; additional words 2c each.*

## POSITION WANTED.

As superintendent or manager of an electric-light plant; have had years' experience and am familiar with all modern methods of installing machinery, construction and interior wiring; prefer a new system to install; can go at once. Address BOX 457, care Western Electrician, 510 Marquette bldg., Chicago.

## POSITION WANTED.

Mechanical and electrical engineer desires position as engineer with manufacturer, large power user, or mining company. Record of first class technical training and experience forwarded on application. Age 34; foreign country no objection; good salary required. Address BOX 459, care Western Electrician, 510 Marquette Bldg., Chicago.

## POSITION WANTED.

A graduate electrical engineer of 1895 who has had nine years' experience, mostly in central station work, of operation and installation, desires a position as superintendent or some such responsible position. Married and 33 years old; can give good references from past employers as to ability and character. Address BOX 460, care of Western Electrician, 510 Marquette Bldg., Chicago.

## WANTED

On or before July 1 next, a second-hand 75 to 100-K. W. 60-cycle 1,100 volt direct connected unit in first class operating condition. State make, type and age, whether right or left hand, floor space required and if it can be seen in operation. Address BOX 454, care Western Electrician, 510 Marquette Building, Chicago.

## WANTED.

City of Boscobel, Wis.

Wanted—An electrician and a fireman for a Municipal Lighting Plant. For particulars address CITY CLERK, Boscobel, Wis. Propositions considered April 5th, 1905.

## FOR SALE.

Consulting electrical and mechanical engineering firm of Chicago desires to sell out its established engineering business. Address BOX 448, care of Western Electrician, 510 Marquette bldg., Chicago.

## FOR SALE.

One 25-H. P. Nash gas engine, direct-connected to 15 K. W. Crocker-wheeler dynamo; can be used for 115 or 230 volts. This would be a first-class outfit for automobile charging station. GRAHAM BROS. CO., 662 Hudson St., New York City.

## FOR SALE.

The city of Coffeyville, Kansas, has for sale the following described machinery, to wit:

2 tubular boilers of 80 horsepower each.

2 ideal engines of 80 horsepower each, speed of same 265.

2 Westinghouse alternators, 60 K. W., 60 cycle, 1,100 volt.

All of the above described machinery is in first-class condition and in use every day. Same can be bought cheap if taken at once as we are about to install a new and much larger equipment. Address all communications to E. L. ROSSITER, Light Commissioner.

## FOR SALE.

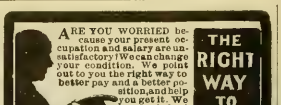
**Electric lighting plant in Western Kentucky, town of 2,000. Business increased 35% last year and still growing; cheap fuel; generators not loaded; good reasons for wishing to sell; easy terms. For full particulars address BOX 458, care Western Electrician, 510 Marquette Building, Chicago, Ill.**

## FOR SALE CHEAP.

4—200 to 330 H. P. 16x27x16-in. WESTINGHOUSE COMPOUND ENGINES.
1—150 to 250 H. P. 14x24x14-in. WESTINGHOUSE COMPOUND ENGINE.
1—400 H. P. BRASS TUBE HEATER.
1—150 H. P. BRASS TUBE HEATER.
2—72-in.x18-ft. BOILERS.
1—66-in.x16-ft. BOILER.
1—8 H. P. OTTO GAS ENGINE

ALSO MANY OTHERS, LET US KNOW YOUR WANTS AND **SAVE MONEY.**

**F. E. PFANNMUELLER & CO.**
No. 733 ROOKERY BUILDING, CHICAGO.



ARE YOU WORRIED because your present occupation and salary are unsatisfactory? We can change your condition. We point out to you the right way to better pay and a better position, and help you get it. We have helped thousands. Is done by our practical mail system in your spare time. Our FREE 80-page book (illustrated) tells of actual experiences, and mentions many examples of how our students have been able to qualify for advancement and good salaried positions. Courses in Electrical Engineering, Steam Engineering, Mechanical Engineering, Telephony, Telegraphy, Electric Lighting, Electric Railways, Electric Motorman's Course, Short Electrical Course, Dynamo Tender's Course, Arithmetic, Algebra. Write TO-DAY for our free book. Mention subject which interests you. ELECTRICAL ENGINEERING INSTITUTE, Dept K, 240A West 23rd St., New York.

Tenth Edition. Just Published.

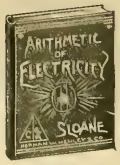
**ELECTRICITY SIMPLIFIED**

By PROF. T. O'CONOR SLOANE

158 Pages. Fully Illustrated. PRICE, $1.00

Contents

CHAPTER I. The Ether; Electricity; Force and Energy; Mass and Weight. CHAPTER II. The Electric Charge; Potential; The Dielectric; Positive and Negative Electricity; Contact Action; Electrostatic Lines of Force; The Leyden Jar. CHAPTER III. The Electric Current and Circuit; Relations of Electromotive Force, Resistance and Current; Velocity of Electricity. CHAPTER IV. Fundamental Units and the Relations Between Electrostatic and Electromagnetic Units; Practical Units; the Volt, Ohm, Coulomb and Ampere; Electric Force, Work and Energy; Chemistry of the Current. CHAPTER V. The Magnetic Circuit and Electromagnetic Lines of Force; Magnet and Ampere's Theory. CHAPTER VI. Electromagnetic Induction and Action of Currents Upon Each Other; The Induction Coil and Its Application. CHAPTER VII. The Galvanic Battery; The Electrotype and the Locus of Its Potential Difference; Polarization and Local Action; Different Examples of Batteries; The Arrangement and Action of Batteries; Storage Batteries. CHAPTER VIII. Dynamos; Motors; Transmission of Power. CHAPTER IX. The Telephone and Microphone; Electric Lighting; The Electric Telegraph; The Dangers of Electricity; Conditions for receiving a Fatal Shock.



Sixteenth Edition. Just Published.

**ARITHMETIC of ELECTRICITY**

By PROF. T. O'CONOR SLOANE

165 Pages. Illustrated. PRICE, $1.00

Contents

CHAPTER I. Introductory. CHAPTER II. Ohm's Law. CHAPTER III. Resistance and Conductance. CHAPTER IV. Potential Difference. CHAPTER V. Circular Mils. CHAPTER VI. Special Systems. CHAPTER VII. Work and Energy. CHAPTER VIII. Batteries. CHAPTER IX. Electro-Magnets, Dynamos and Motors. CHAPTER X. Demonstration of Rules. CHAPTER XI Notation in Power of Ten. Tables.

**Standard Electrical Dictionary**

By PROF. T. O'CONOR SLOANE

682 Pages. 393 Illustrations. PRICE, $3.00

An Entirely New Edition, Brought Up To Date and Greatly Enlarged. Complete—Concise—Convenient.

A practical handbook of reference, containing definitions of about 5,000 distinct words, terms and phrases.

The work is absolutely indispensable to all in anyway interested in electrical science, from the higher electrical expert to the everyday electrical workman. In fact it should be in the possession of all who desire to keep abreast with the progress of this branch of science.

Fifteenth Edition. Just Published.

**ELECTRIC TOY MAKING**

**DYNAMO BUILDING and ELECTRIC MOTOR CONSTRUCTION**

By PROF. T. O'CONOR SLOANE

185 Pages. Very Fully Illustrated. PRICE, $1.00.

Contents

CHAPTER I. Batteries. CHAPTER II. Permanent Magnets. CHAPTER III. Electro-Magnets. CHAPTER IV. Electric Motors. CHAPTER V. Electric Bells. CHAPTER VI. Miscellaneous Toys. CHAPTER VII. Spark and Induction Coils, and Allied Subjects. CHAPTER VIII. Hand-Power Dynamo. CHAPTER IX. Miscellaneous Receipts and Formulæ.

Twelfth Edition. Just Published.

**How to Become a Successful ELECTRICIAN**

By PROF. T. O'CONOR SLOANE

200 Pages. Illustrated. PRICE, $1.00

Contents

CHAPTER I. Introductory. CHAPTER II. Mathematics. CHAPTER III. Physics. CHAPTER IV. Chemistry. CHAPTER V. Electricity at Home. CHAPTER VI. Mechanical Engineering. CHAPTER VII. Drawing. CHAPTER VIII. Teachers. CHAPTER IX. Electrical Factory Work for Students. CHAPTER X. College Education. CHAPTER XI. Steam Engineering CHAPTER XII. The Manufacturing Engineer. CHAPTER XIII. The Constructing Engineer. CHAPTER XIV. The Station Engineer. CHAPTER XV. Inventing. CHAPTER XVI. Original Investigation. CHAPTER XVII Success. CHAPTER XVIII. Reading. CHAPTER XIX. Ethics.

# Keep Up With the Procession.

**Everyone engaged in the electrical business should keep posted on the developments in the art by reading the latest books on the subject. We are headquarters in the West for electrical books and can fill orders for any work published, promptly on receipt of price. We call your special attention to the following standard books:**

ALLSOP, F. C.—Electrical Bell Construction; Treatise on the Construction of Electric Bells, Indicators and similar apparatus. 177 illustrations.....$1.25

ATKINSON, PHILIP.—The Elements of Electric Lighting. Seventh edition, fully revised, and new matter added. 104 illustrations. 260 pages.....$1.50

ATKINSON, PHILIP.—The elements of Dynamic Electricity and Magnetism. 406 pages and 117 illustrations. Second edition .....$2.00

AYRTON, W. E.—Practical Electricity; a Laboratory and Lecture Course for First-year Students of Electrical Engineering. Based on the Practical Definitions of the Electrical Units. With numerous illustrations. Sixth edition .....$2.50

BADT, LIEUT F. B.—New Dynamo Tenders' Hand Book. This is, as the name indicates, a NEW BOOK, much more complete than the old one, with all the information, instructions and rules which are required by practical men, as Dynamo Tenders, Linemen, Stationary Engineers and owners and operators of all kinds of Electric Plants. It is the only book of the kind published in the English language. 228 pages, 140 illustrations, flexible cloth binding, size of type page 5½x3 inches .....$1.00

BADT, LIEUT. F. B.—Incandescent Wiring Hand Book. A timely book containing full illustrations for incandescent wiring and complete information concerning methods of running wires, location of safety devices, splices, insulation, testing for faults, wire gauges, general electrical data, calculating sizes of wires, wiring fixtures, elevators, buildings, isolated and central station plants. The only book of the kind published. Type page 5½x3 inches, flexible cloth binding, 66 pages, 46 cuts and 5 tables, 3 of which are 12x18 inches.....$1.00

BADT, LIEUT. F. B.—Bell Hangers' Hand Book. Just the book for people engaged in selling, installing or handling electric batteries, electric bells, elevators, house or hotel annunciators, burglar or fire alarms, electric gas lighting apparatus, electric heat apparatus, 106 pages, 97 illustrations, flexible cloth binding. Type page 5½x3 inches.....$1.00

BADT, LIEUT. F. B.—Electric Transmission Hand Book. First edition, 3,000 copies. 97 pages, 22 illustrations, 27 original tables .....$1.00
Gives more Practical information on the subject than any work published to date. The book contains all necessary information for Fuse Producers, Capitalists, Agents, Engineers and Motor Inspectors. With this book anybody may make estimates on the cost of Transmission Plants.

BEDELL, FRED'K, AND ALBERT C. CREHORE.—Alternating Currents; An Analytical and Graphical Treatment for Students and Engineers. Second edition. 112 illustrations .....$2.50

BELL, LOUIS, PH. D.—The Art of Illumination; This is the only book in the language which deals directly with the scientific and artistic use of modern illuminants, electric and other. Cloth, 339 pages, 127 illustrations. Price .....$2.50

BONNEY, G. E.—Electro-Plater's Hand Book, A Manual for Amateurs and Young Students on Electro-Metallurgy. 60 illustrations, 208 pages. 12mo. cloth....$1.25

BOTTONE, S. R.—Electrical Instrument Making for Amateurs. A Practical Hand Book, with 48 illustrations. Fourth edition. Enlarged by a chapter on the Telephone .....$0.50

BOTTONE, S. R.—The Dynamo, How Made and How Used. A Book for Amateurs. Eighth edition, with additional matter and 39 illustrations.....$1.00

BOTTONE, S. R.—Electro-Motors. How Made and How Used. A Hand Book for Amateurs and Practical Men. Revised to .....$0.50

BUCKLEY, W. J.—Electric Lighting Plants, Their Cost and Operation. 275 pages, many illustrations and diagrams. Paper .....$1.00

CROCKER, F. B. AND WHEELER, S.—The Practical Management of Dynamos and Motors. With a special chapter by H. A. Foster. Illustrated. Second edition, revised and enlarged.....$1.00

CUSHING, H. C.—Standard Wiring for Electric Light and Power. A compilation of formulæ, rules and requirements from the most modern practice, and in accordance with the rules and requirements of the Boston Fire Underwriters' Union, the New England Insurance Exchange, and as recommended by the Underwriters' International Electric Association. 12mo, leather .....$1.00

DESMOND, CHAS.—Electricity for Engineers. Part I. Constant Current. A clear and comprehensive treatise on the principles, construction and operation of Dynamos, Motors, Lamps, Indicator and Measuring Instruments; also a full explanation of the electrical terms used in the work. Part II. Alternate Current Apparatus. Containing a full explanation of the principles governing the generation of, and a description of the instruments and machinery used in connection with, Alternate Electric Currents. Illustrated. Revised edition .....$2.50

DOBBS, A. E.—The Inspector and Trouble Man. A practical book, written in plain language. Full of information and diagrams for the operator, exchange manager, inspector, trouble man and lineman. A complete description of telephones, how to find and remedy their troubles, together with working plans for exchange construction, complete with diagrams of all up-to-date telephones and switchboards. 106 pages. Price...$1.00

DYER, A.—Induction Coils, How Made and How Used. Third edition. Boards .....$0.50

FLEMING, J. A.—Short Lectures to Electrical Artisans. A course of Experimental Lectures delivered to a Practical Audience. Fourth edition. 74 illustrations..$1.50

FLEMING, J. A.—The Alternate Current Transformer in Theory and Practice. Vol. I. The Induction of Electric Currents. 500 pages, fully illustrated and with copious index. Second edition .....$3.00
Synopsis of contents: Chapter 1. Introductory. 2. Electro-Magnetic Induction. 3. The Theory of Simple Periodic Currents. 4. Mutual and Self Induction. 5. Dynamical Theory of Current Induction.
Vol. II. The Utilization of Induced Currents. 8vo, cloth. London, 1892 .....$5.00

GAYETTY, J. W.—Motorman's Guide. A Practical Treatise on Street Railway Motors. Illustrations and diagrams. Cloth .....$0.50

GORDON.—School Electricity. Sources, Currents, Measurement, Telegraphy, Telephony, Lightning, Electrolysis, Induction, etc. 262 pages, with 140 illustrations..$2.00

GORE, G.—The Art of Electro-Metallurgy, including all Known Processes of Electro Deposition. Fourth edition .....$2.00

GRIER, THOS. G.—Wiring for Motor Circuits. A handy little pamphlet containing tables for wiring and for motor service, arranged in convenient form for ready reference .....$1.00

HASKINS, C. C.—Electricity Made Simple. 233 pages, 108 illustrations. Paper covers.....$0.50
A valuable, non-technical work for those whose opportunities for gaining information on the branches treated have been limited.

HASKINS, C. H.—The Galvanometer and Its Uses. A Manual for Electricians and Students. Fourth edition; revised .....$1.50

HASKINS.—Transformers. Their Theory, Construction and Application Simplified. 38 illustrations.....$1.25

HAWKINS, C. C. AND F. WALLIS.—The Dynamo, Its Theory, Design and Manufacture. 190 illustrations.$3.00

HAWKINS, N.—New Catechism of Electricity. A Practical Treatise Relating to the Dynamo and Motor, Wiring, the Electric Railway, Bell Fitting, etc., etc. Red leather, pocketbook form. 95 illustrations....$2.00

HOMANS, J. E., A. M.—A, B, C OF THE TELEPHONE. 352 pages, 269 illustrations. Price.....$1.00
Owing to the demand for a comprehensive book giving a clear, terse idea of the principles governing the construction, installation, care and management of telephones and their appliances, this book has been compiled. It has been the aim of the author to make this the most complete elementary book on this subject for the practical electrician, wireman, lineman and engineer, and it is written in a clear and careful style.

HOPKINS, GEO. M.—Experimental Science. Elementary, Practical and Experimental Physics. 650 illustrations .....$4.00

HOPKINSON.—Original Papers on Dynamo Machinery and Allied Subjects. Illustrated.....$1.00

HOPKINSON, DR. JOHN.—Dynamic Electricity; Its Modern Use and Measurements, Chiefly in Its Application to Electric Lighting and Telegraphy .....$0.50

HORSTMANN, H. C. AND VICTOR H. TOUSLEY.—Modern Wiring Diagrams and Descriptions. A Hand Book of Practical Diagrams and Information for Electrical Workers. 160 pages, over 200 illustrations. Full leather binding. Pocket size 4x6.....$1.50

HOSPITALIER, E.—Domestic Electricity for Amateurs; Translated from the French, with additions by C. J. Wharton. With illustrations.....$2.50

HOUSTON, EDWIN J.—A Dictionary of Electrical Words, Terms and Phrases. Fourth edition, greatly enlarged, with over 6,000 additional words and definitions. 2 volumes, 1,000 pages.....$6.00

KAPP, GISBERT.—Electric Transmission of Energy and Its Transformation, Subdivision and Distribution. A practical hand book. Fourth edition.....$3.00

KAPP, GISBERT.—Alternate Current Machinery, Illustrated .....$0.50
(Vol. 96. Van Nostrand's Science Series.)

KAPP, GISBERT.—Dynamos, Alternators and Transformers. 138 illustrations.....$4.00

KEMPPE, H. R.—A Hand Book of Electrical Testing. Fifth edition. 200 illustrations. 8vo, cloth. London 1892 .....$7.25
In this edition there is a considerable amount of new matter; the old matter has been thoroughly revised.

KEMPE, H. R.—The Electrical Engineer's Pocket Book. Modern Rules, Formulæ, Tables, and Data. 32mo, leather .....$1.75

LOCKWOOD, T. D.—Electricity, Magnetism and Electric Telegraphy. A Practical Guide and Hand Book of General Information for Electrical Students, Operators and Inspectors. 376 pages, 162 illustrations.....$2.50

LOCKWOOD, T. D.—Electrical Measurement and the Galvanometer; Its Construction and Use. Second edition .....$1.50

LYNDON, L.—Storage Battery Engineering. A Practical Treatise for Engineers. This is a practical work, intended for the electrical engineer who is called on to design and install storage battery equipments, or who has a battery power plant under his care. Cloth. 360 pages, 178 illustrations and diagrams, 4 large folding plates. Price .....$3.00

MEADOWCROFT, W. H.—The A, B, C of Electricity. 36 illustrations. 12mo, cloth. New York.....$0.50

MAVER AND DAVIS, M. M.—The Quadruplex. With Chapters on the Dynamo-Electric Machine in Relation to the Quadruplex. The Practical Working of the Duplex Telegraph Repeaters and the Wheatstone Automatic Telegraph. 63 illustrations.....$1.50

MEYER, HENRY, C., JR., M. E.—Steam Power Plants. Their Design and Construction. Cloth. 165 pages, 63 illustrations, 15 folding plates. Price.....$2.00

MILLER, KEMPSTER B.—American Telephone Practice. 518 large octavo pages, 379 illustrations.....$3.00
This book treats of the subject in a simple and comprehensive manner from the practical standpoint, and almost entirely without the use of mathematics.

NOLL, AUGUSTUS.—How to Wire Buildings. A manual of the art of interior wiring. Illustrated.....$1.50

POPE, FRANKLIN LEONARD.—Modern Practice of the Electric Telegraph. A technical hand book for Electricians, Managers and Operators. 185 illustrations. Fourteenth edition, rewritten and enlarged.....$1.50

PRINDLE, H. B.—A Popular Treatise on the Electric Railway of To-day. Fully illustrated.....$0.25

REED, LYMAN C.—American Meter Practice. This is the only American book dealing with the theory and practice of current metering. Cloth. About 250 pages, illustrated. Price .....$2.00

RUSSELL, STUART A.—Electric Light Cables and Distribution of Electricity. 107 illustrations.....$2.25

SALOMONS, SIR DAVID.—Electric Light Installations. Vol. I. The Management of Accumulators. A Practical Hand Book. Seventh edition, revised and enlarged. With illustrations. 12mo, cl. London, 1893.....$1.50

SLOANE, T. O'CONNOR.—Electricity Simplified. The Practice and Theory of Electricity. Including a Popular Review of the Theory of Electricity, with Analogies and Examples of Its Practical Application in every day life. Illustrated .....$1.00

SLOANE, T. O'CONNOR.—The Standard Electrical Dictionary. A popular dictionary of words and terms used in the practice of electrical engineering. 350 illustrations .....$3.00
Comprehensive book giving a clear, terse idea of the principles governing the construction, installation, care and management of telephones and their appliances, this book has been compiled. It has been the aim of the author to make this the most complete elementary book on this subject for the practical electrician, wireman, lineman and engineer, and it is written in a clear and careful style.

SLOANE, T. O'CONNOR.—Electric Toy Making for Amateurs, including Batteries, Magnets, Motors, Miscellaneous Toys .....$1.00

SLOANE, T. O'CONNOR.—The Arithmetic of Electricity. A Manual of Electrical Calculations by Arithmetical Methods, including numerous rules, examples and tables in the field of practical electrical engineering and instrumenting. Third edition, revised.....$1.00

STEVENS, H. G.—Mechanical Catechism. For Stationary and Marine Engineers, Firemen, Electricians, Motormen, Ice Machine Men and Mechanics in General. 336 pages, over 240 illustrations. Cloth .....$1.00

THOMPSON, SYLVANUS P.—Dynamo-Electric Machinery. A series of lectures, with an introduction by Franklin L. Pope. 16mo. Numerous illustrations, fancy boards (Van Nostrand's Science Series, No. 66).....$0.50

THOMPSON, SYLVANUS P.—Polyphase Electric Currents and Alternate-Current Motors. Mailed to any address in the world on receipt of.....$3.50

THOMPSON, SYLVANUS P.—Recent Progress in Dynamo-Electric Machines, being a Supplement to Dynamo-Electric Machinery. 32mo. (Van Nostrand's Science Series, No. 75).....$0.50

THOMPSON, SYLVANUS P.—Dynamo-Electric Machinery. Eighth edition, revised and rewritten. Numerous illustrations and 19 plates. Nearly 1,000 pages.....$6.00

THURSTON, PROF. R. H.—Stationary Steam Engines, Especially Adapted to Electric Lighting Purposes. Treating of the development of Steam Engines, the Principles of Construction and Economy, and a description of Moderate and High Speed Engines. With many folding plates .....$2.50

TREVERT.—How to Make Electric Batteries at Home. Illustrated .....$0.25

URQUHART.—Electro-Plating. A Practical Hand Book on the Deposition of Copper, Silver, Nickel, Gold, Aluminum, Brass, Platinum, etc. Second edition; carefully revised, with additions.....$2.00

WALKER, F.—Practical Dynamo Building, for Amateurs. How to wind for any output. With numerous illustrations. 16mo, boards. (Van Nostrand's Science Series, No. 98).....$0.50

WEBB, H. L.—A Practical Guide to the Testing of Insulated Wires and Cables. Illustrated.....$1.00

WEBB, HERBERT LAWS.—Telephone Hand Book. Illustrated. 12mo, cloth. Chicago, 1895.....$1.00
The only complete work on the Telephone. All possible information for any one interested in Telephones and how to make and operate them.

WEBER.—The Handy Vest Pocket Electrical Dictionary. Cloth .....$0.25
Leather .....$0.50

Mechanical Perfection

## BURGER
## AUTOMATIC GAS ENGINE

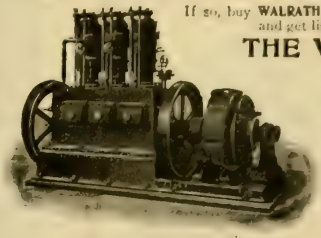
The only strictly automatic cut-off Gas Engine in the world. For electric work unsurpassed, giving regulation unequaled by any steam engine. Adapted to use any fuel with the best satisfaction and the greatest economy, producing one H. P. per hour on one lb. of coal. For a money saver power users should investigate.

Correspondence solicited.

WOOLLEY FOUNDRY AND MACHINE WKS.
Anderson, Ind.

## ARE YOU LOOKING FOR MONEY?

If so, buy WALRATH GAS OR GASOLINE ENGINES and get light on the subject.



## THE WALRATH

Received the Highest Award at the Pan-American Exposition.

It will produce as good a commercial light as that of an automatic steam engine, either belted or direct-connected generator. Simple, Economical and Reliable.

# MULTIPLE SERIES FORM C ARC LAMPS

Operate two in series on 220 to 250 volts and five in series on 500 to 575 volts.

Have automatic cutout that substitutes an equivalent resistance in place of a lamp in which the carbons have been consumed, without interference with other lamps in series with it.

Entirely self-contained, has no separate rheostat or switch.

Can be trimmed without interference with other lamps in circuit.

And they belong in the High Grade Form C Class.

## It Can't Be Beat—The Guthrie Flasher

A SIGN FLASHER WITHOUT A MOTOR

**A FEW ADVANTAGES OF THIS FLASHER OVER ALL OTHERS:**

*First.*—The Price is lower.
*Second.*—It has fewer parts and is therefore the simplest flasher on the market.
*Third.*—It has no motor to cause trouble and consume current.
*Fourth.*—It costs nothing to operate this flasher.
*Fifth.*—It only occupies a space of 5 x 8 inches.
*Sixth.*—It can be regulated to flash any signs or show window lights in any manner desired.
Any combination of lights, without motor or cylinder.
Simplest and best on the market.
Works on any current.
The disadvantage of a flasher was the motor question. We have overcome this and are putting out an article that meets a long felt want.

Illuminated Dial Station Instruments.

These Instruments are constructed upon the same general principle as our regular Standard Portable Direct Current Voltmeters and Ammeters, but are much larger, and the working parts are inclosed in a neatly designed, dust-proof cast-iron case which effectively shields the instruments from disturbing influences of external magnetic fields.

Weston Standard Illuminated Dial Station Ammeter, Style B.

Weston Standard

Portable Direct Reading Voltmeters and Millivoltmeters. Ammeters and Milliammeters, Wattmeters and Voltmeters, for Alternating and Direct Current Circuits.

Our portable instruments are recognized as standards throughout the civilized world.

Our Semi-Portable Laboratory Standard Voltmeters and Ammeters are still better.

They are the most reliable, absolute standards for Laboratory use.

The Use of

## Bullock Type "N" Motors

for driving machine tools

Is a profitable Investment.

They are very compact
Are mounted to take up but little space
Will stand heavy overloads without injury to windings
Will operate with no more attention than occasional oiling

Bullock D-C and A-C Apparatus in all Capacities up to 10,000 kw.

Canadian representatives, Allis-Chalmers-Bullock, Ltd., Montreal

# "FEMCO" INCANDESCENT LAMPS.

Why would not to-day be a most excellent time to send us a trial incandescent lamp order?

We can furnish you with anything you want, lamps of any candlepower voltage, efficiency desired, perfect lamps in every respect.

Our guarantee follows our Lamps.

Catalogue and prices on application.

Western selling agents wanted.

If you want the best you must buy the

## CONSTANT USE OF THE C-H. FIELD REGULATOR HAS PROVEN

That the material of which its base is made does not allow grounding; that overloads do not disintegrate it; that it readily radiates and conducts heat, and is a perfect insulator. Its construction is such that no trouble can exist from small parts or contacts. Bulletin 32 explains in detail.

THE CUTLER-HAMMER MFG. CO.

MILWAUKEE, WIS.

NEW YORK CHICAGO PITTSBURG BOSTON

**A PERFECT SOLDERING FLUX.**

Adapted to soldering Electrical Connections without injury to insulation, producing clean, perfect joints on all metals. Will not rust or corrode, therefore increases durability of all sheet metal work. A time-saver in construction of roofing, leaders, gutters, refrigerators, ornamental work, and all branches of the canning industry. Large package in fluid, paste or stick form, prepaid by mail, **25 cents.** Satisfaction Guaranteed. Liberal discount to dealers. Special prices to those desiring to use Flux in large quantity. THE UNIVERSAL CO., 537 West 149th St., New York.

When a man's electrical business shows a steady and healthy growth; when he sees only the bright side of things and never endeavors to discover a possible dark side; when he says business conditions are improving, you will be pretty safe in assuming that he advertises in the Western Electrician 52 times a year.

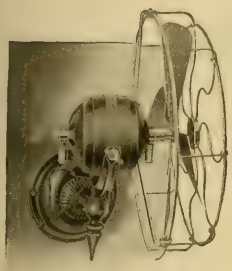
## 1905 FAN MOTORS



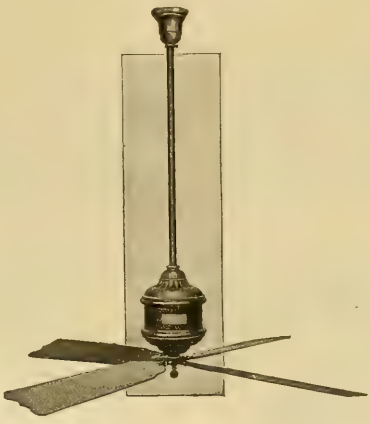
16-in. Wall Bracket Fan (D. C.)

**The thoughtful dealer always remembers that the customer looks for** **on his fan motor just as he does for "sterling" on his silver.**

12-in. Convertible Swivel and Trunnion Frame Desk Fan (A. C.). Low frequency for 25 and 40 cycles, commutating type.

### Direct-Current Fan Motors

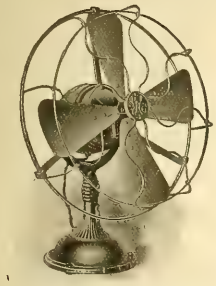
Are for operation on 115 and 230 volt circuits. They have three speeds. They are finished in black enamel, and the fan guard and the trimmings are of lacquered brass.



Three-Speed 58-in. Ceiling Fan (D. C.). Bipolar Type.

### Alternating Current Fan Motors

Are for operation on 100/115 and 190/220 volts, and 25, 40, 60 and 125/140 cycle circuits. The finish, guard and trimmings are identical with those of the direct-current fans.



16-in. Convertible Swivel and Trunnion Frame Desk Fan (D. C.).

**A few of the many good points of the General Electric Desk Fan:**

**Extremely low-current consumption.**

**Continuous operation without overheating.**

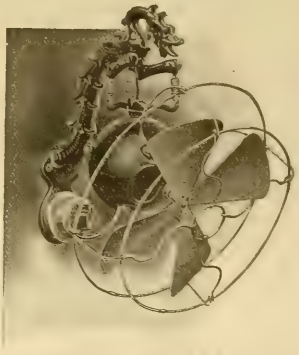
**Oil-catching device to prevent any scattering of oil.**

**Adaptability for use on either desk or bracket.**

**Ample trunnion adjustment.**

**A STOCK OF FAN MOTORS IS CARRIED IN ALL OUR LOCAL STOREROOMS.**

**If you are interested in THE BEST in desk, wall bracket, exhaust and ceiling fans and ventilating outfits, why not write us for our new descriptive catalogue?**



Telephone Booth Fan (A. C. or D. C.).

**UNIT" ENAMELED RHEOSTATS**
SIMPLEX ELECTRIC HEATING CO.,
Cambridgeport, Mass.

The cumulative feature of advertising is ofttimes overlooked. This is the case more especially with a man who is entering upon his first advertising campaign. He frequently expects immediate and large returns; and if the returns are not as prompt and as great as he thinks they should be he is tempted to throw the entire blame upon the advertising medium.

Assuming that his ad occupies a reasonable amount of space, is attractive, and in the right medium, it will bring returns later if not earlier. The seed is being sown. The harvest time will come in the future.

It is necessary to make your name and your product familiar to the readers of the journal or journals in which you are advertising. Seeing your ad repeatedly they gradually acquire confidence in your business stability and in the goods you make.

They memorize your name unconsciously. When they are in the market for your class of goods they will write you, or they will give the order to your representative when he calls.

It takes time to educate the buyer. Advertising in the Western Electrician will educate an army of buyers at one and the same time.

**WANTED, FOR SALE** *and similar* **WANT COLUMN** *advertisements (50 words or less), $1.50 an insertion; additional words 3c each.* **POSITION WANTED** *advertisements (50 words or less), $1.00 an insertion; additional words 2c each.*

## POSITION WANTED.

By first-class steam and electrical engineer with 28 years' experience in the operation of power plants. Wishes to invest $1,000 and take position on official or operating forces in either lighting, power, manufactory or electrical machine shop; thoroughly understand handling financial and technical part of work. Strictly sober and educated. Address BOX 461, care Western Electrician, 510 Marquette Bldg., Chicago, Ill.

## POSITION WANTED.

As mechanical electrician, to take charge of electric-lighting and power plant; thoroughly understands direct-current dynamos and motors. Am familiar with all kinds of mining machinery and modern methods of interior wiring and construction work; married; 26 years old; can furnish best of references in regard to character and ability. Address BOX 462, care of Western Electrician, 510 Marquette Bldg., Chicago, Ill.

## WANTED.

One 80-kw. and one 60 or 75-kw. second-hand dynamo. Must be 60 cycle; prefer 3-phase, 2,300-volt machines; also 100-h. p. automatic engine. Machinery must be in first-class condition and a bargain. Give full particulars. LYONS ELECTRIC & MFG. CO., Lyons, Kan.

## FOR SALE.

One 25-H. P. Nash gas engine, direct-connected to 15-K. W. Crocker-wheeler dynamo; can be used for 115 or 230 volts. This would be a first-class outfit for automobile charging station. GRAHAM BROS. CO., 662 Hudson St., New York City.

## FOR SALE.

The city of Coffeyville, Kansas, has for sale the following described machinery, to wit:

2 tubular boilers of 80 horsepower each.

2 ideal engines of 80 horsepower each, speed of same 265.

2 Westinghouse alternators, 60 K. W., 60 cycle, 1,100 volt.

All of the above described machinery is in first-class condition and in use every day. Same can be bought cheap if taken at once as we are about to install a new and much larger equipment. Address all communications to E. L. ROSSITER, Light Commissioner.

SUSPENDED REVOLVING "WOOD" FAN MOTORS

GREATEST DISTRIBUTION OF THE AIR IN ALL DIRECTIONS

These automatic air distributors require no more energy than the stationary desk type or the wall bracket type "wood" fans, and that is less than one-half as much as a 16 candlepower incandescent lamp. Let us tell YOU more.

Security Cable Distributing Panels
Are Safe and Handy and Cheap

THESE are suitable for use in any ordinary pole box, or can be placed on the walls of an exchange or elsewhere, as may be desired. They are generally used in pairs. The panels are oak, highly finished, with a front of hard rubber on which the contacts are mounted. The cables may enter from below or from above and the copper wires will spread to the inner rows of contacts on both sides. The connection is made by a screw, threaded into metal and provided with a washer. This joint should of course be soldered permanently. The spider wires attach to the outer rows of contacts and are connected in the same way and should also be soldered. By so doing permanent results are reached, which is not the case in boards where there are no washers nor solder and where the screws go into wood instead of into metal. These boards can be used for metallic circuits or grounded or common return. There is nothing made which is so compact, convenient nor as economical. An electrician can make a good part of the price in the time he will save in first connecting the cables, not counting the subsequent convenience of making cross-connections, should they be desired.

Prices, including fuses of any amperage from ¼ to ½, 10c per conductor, or 20c per pair. A discount of 5 per cent. on orders of 750 or more conductors.

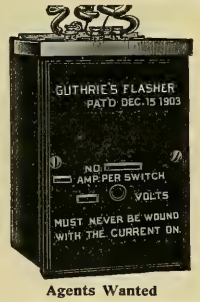
## It Can't Be Beat—The Guthrie Flasher

A SIGN FLASHER WITHOUT A MOTOR



Agents Wanted

A FEW ADVANTAGES OF THIS FLASHER OVER ALL OTHERS:

*First.*—The Price is lower.
*Second.*—It has fewer parts and is therefore the simplest flasher on the market.
*Third.*—It has no motor to cause trouble and consume current.
*Fourth.*—It costs nothing to operate this flasher.
*Fifth.*—It only occupies a space of 5 x 8 inches.
*Sixth.*—It can be regulated to flash any signs or show window lights in any manner desired.
Any combination of lights, without motor or cylinder.
Simplest and best on the market.
Works on any current.
The disadvantage of a flasher was the motor question.
We have overcome this and are putting out an article that meets a long felt want.

# Preeminently the Storage Battery

It costs no more than the Cell Type.

It has comparatively, considerably more active material and occupies less space (about half that required by Cell Type).

It is far more durable—is cleaner and more economical in operation and much less expensive in cost of maintenance.

Besides, this important fact must not be overlooked: There are no annoying and destructive fumes as with the Cell Type. The gas does not escape, therefore no corrosion of adjacent pipe or iron work or even the tarnishing of bright metal work.

Every business consists in having something to sell—and selling it.

The selling consists in locating possible customers through advertising or otherwise, and then converting the possible into actual customers by convincing arguments and proof that your product has certain merits peculiar to itself.

Advertising consists in telling your story forcefully and effectively, through the use of printer's ink, to a large number of possible purchasers.

Trade journal advertising consists in telling your story to a special class—to those only who are interested in the purchase of the article which you wish to sell.

The manufacturer of machinery or supplies for electrical people will naturally advertise in an electrical journal.

In advertising in an electrical journal he will desire to reach at the least expense the greatest number of possible buyers.

He may desire to reach chiefly a certain section of the country.

He will certainly desire to patronize that publication which has the reputation of bringing advertising returns.

He will ascertain the advertising rates of the WESTERN ELECTRICIAN.

He will advertise in the WESTERN ELECTRICIAN.

**WANTED, FOR SALE** *and similar* **WANT COLUMN** *advertisements (50 words or less), $1.50 an insertion; additional words 3c each.* **POSITION WANTED** *advertisements (50 words or less), $1.00 an insertion; additional words 2c each.*

## POSITION WANTED.

By first-class steam and electrical engineer with 23 years' experience in the operation of power plants. Wishes to invest $1,000 and take position on official or operating forces in either lighting, power, manufactory or electrical machine shop; thoroughly understand handling financial and technical part of work. Strictly sober and educated. Address BOX 461, care Western Electrician, 510 Marquette Bldg., Chicago, Ill.

## WANTED.

To employ in every city in the United States and Europe, a responsible, intelligent, temperate man, as agent for the sale of a no-acid, non-corrosive Soldering Flux. THE UNIVERSAL CO., 537 West 149th St., New York.

## FOR SALE.

One 25-H. P. Nash gas engine, direct-connected to 15-K. W. Crocker-wheeler dynamo; can be used for 115 or 230 volts. This would be a first-class outfit for automobile charging station. GRAHAM BROS. CO., 662 Hudson St., New York City.

## FOR SALE.

An electric-light plant near Chicago; no gas, no competition of any kind. New 15-year franchise, new 10-year contract for 40 lamps, 12:00 o'clock moonlight schedule, $60.00 a year. Gross income now about $7,000 per year, can be increased to $10,000 per year. Can be bought at a bargain if taken at once. BOX 465, care of Western Electrician, 510 Marquette Bldg., Chicago.

ELECTRICIAN PUBLISHING CO., 510 Marquette Building, - - CHICAGO

A VALUABLE BOOK OF REFERENCE.

## TELEPHONES—Their CONSTRUCTION and FITTING.

A Practical Treatise on the Fitting-up and Maintenance of Telephones and the Auxiliary Apparatus.

BY F. C. ALLSOP.

CONTENTS:

CHAPTER I.—Receivers; II.—Transmitters; III.—Magneto Switch-Bells; IV.—Battery Switch-Bells; V.—Complete Instruments; VI.—Switches, Switchboards and Extension Bells; VII.—Batteries for Telephone Work; VIII.—Erecting Wires, Instruments, Etc.; IX.—Arranging the Circuits; X.—Intercommunicating System; XI.—Testing for and Removing Faults.

184 PAGES. 156 ILLUSTRATIONS AND FOLDING PLATES. PRICE, $1.25.

Sent prepaid on receipt of price.

ELECTRICIAN PUBLISHING CO., 510 Marquette Bldg., Chicago.

## A PRACTICAL BOOK FOR PRACTICAL MEN

"MODERN WIRING DIAGRAMS AND DESCRIPTIONS FOR ELECTRICAL WORKERS."

By Henry C. Horstmann and Victor H. Tousley. 160 pages, over 200 illustrations. Full leather binding, red edges. Pocket size 4 x 6. Price, net, $1.50.

**A work that not only tells you how to do it, but shows you.**

THIS BOOK tells how to wire for call and alarm bells. For burglar and fire alarm. How to run bells from dynamo current. How to install and manage batteries. How to test batteries. How to test circuits. How to wire for annunciators; for telegraph and gas lighting. It tells how to locate "trouble" and "ring out" circuits. It tells about meters and transformers. It contains 50 diagrams of electric lighting circuits alone. It explains dynamos and motors; alternating and direct current. It gives 10 diagrams of ground detectors alone. It gives "Compensator" and Storage Battery installation. It gives simple and explicit explanations of the "Wheatstone Bridge" and its uses as well as volt meter and other testing. It gives a new and simple wiring table, covering all voltages and all losses or distances, etc., etc.

SENT PREPAID ON RECEIPT OF PRICE

ELECTRICIAN PUBLISHING CO.

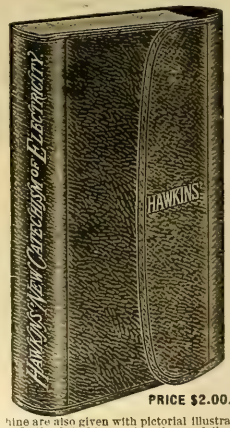
# HAWKINS' NEW CATECHISM OF ELECTRICITY.

## Plan of the Work, Contents, Etc.



PRICE $2.00.

The New Catechism of Electricity will be found to be surprisingly plain, and free from useless and ambiguous terms. The plan upon which it is arranged is unique.

The book is, first of all, intended to be plain and instructive; some 300 illustrations have been introduced, so that the mere pictures will afford almost a knowledge of the subjects.

It is a school book from the manner in which it proceeds from the simple facts to the abstract principles which the facts indicate; it is also a book of reference through the index of seventeen double columns of fine type pages; by means of this index a thousand items of practical importance are at once available.

It is an up-to-date work, which has cost a large outlay of capital and time, and, in short, it is doubtful if any more attractive book has ever been issued—or one more useful.

The subjects treated upon are as follows: Dedication to Thomas A. Edison, with engraving of Mr. Edison; Preface and Introduction; Nature and Source of Electricity and Magnetism.

The Dynamo; Conductors and Non-Conductors; Symbols, abbreviations and definitions relating to electricity; Parts of the Dynamo; The Motor; The Care and Management of the Dynamo and Motor.

Electric Lighting; Wiring; The rules and requirements of the National Board of Underwriters in full; Electrical Measurements.

The Electric Railway; Line Work; Instruction and Cautions for Linemen and the Dynamo Room; Storage Batteries; Care and Management of the Street Car Motor; Electro Plating.

The Telephone and Telegraph; The Electric Elevator; Accidents and Emergencies, etc., etc.

The full one-third part of the whole work has been devoted to the explanation and illustrations of the dynamo, and particular directions relating to its care and management;—all the directions are given in the simplest and most kindly way to assist rather than confuse the learner. The names of the various parts of the machine are also given with pictorial illustrations of the same.

In the Catechism no less than 25 full page illustrations have been given of the various dynamo machines made in different parts of the country, and an equal number of part page illustrations.

# THE TELEPHONE HAND-BOOK

**NEW AND REVISED EDITION, WITH A NEW CHAPTER ON "RECENT PROGRESS," BRINGING THE BOOK UP TO DATE.**

**BY HERBERT LAWS WEBB.**

*Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."*

**160 Pages, 133 Illustrations, Cloth, Hand-Book Size, Price $1.00.**

**Extract from Preface.**—"This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book on telephone working and management, and the TELEPHONE HAND-BOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice; and most of the material, apparatus and methods described are peculiar to or have originated in this country."

No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that anyone can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

**CONTENTS**

CHAPTER 1. The Invention of the Telephone.
2. Sound Waves. Articulate Speech.
3. Electric Telephony. The Bell Telephone.
4. The Microphone.
5. Current Induction. Electromagnetic Induction.
6. The Induction Coil: Its Use in the Telephone Transmitter.
7. The Complete Telephone Circuit.
8. Magnet Telephones.
9. The Bell Telephone Receiver.
10. Other forms of Magnet Telephones.
11. The Gower, Ader and D'Arsonval Receivers, Mercadier's Bi-Telephone.
12. The Siemens, Kotyra, Neumayer and Böttcher Receivers.
CHAPTER 13. Carbon Transmitters.
14. The Blake Transmitter.
15. The Long Distance Transmitter.
16. The Solid-back Transmitter.
17. The Berliner Transmitter.
18. The Cuttriss Transmitter.
19. Various European Transmitters.
20. The Efficiency of Carbon Transmitters.
21. Batteries for Telephone Work.
22. Open Circuit Batteries.
23. Closed Circuit Batteries.
24. The Practical Management of Batteries.
25. Magneto Bell.
26. Automatic Switches.
27. Telephone Line Construction.

# The Electro-Magnet

—BY—

TOWNSEND WOLCOTT, A. E. KENNELLY, RICHARD VARLEY.

**PRICE, ONE DOLLAR,**

**CONTENTS.**

General Properties. Magnetic Field of Force. Magnetic Units. Induced Magnet. Reluctance. Permeability. Discovery of Electro-Magnetism. Iron Ring in the Magnetic Field. Calculation of Magnet Windings. Magnetic Circuit. Given Ampere-Turns to Find Proper Current. Relation of Ampere-Turns to Wire Space. Room Occupied by Insulation. Heating and Other Limiting Conditions. Winding a Magnet for a Given Voltage. Hysteresis, Self-Induction. Alternating Currents. Traction.

On the Relative Values of the Windings of Electro-Magnetic Coils. Properties of Fixed Winding Spaces and a Fixed Size of Wire. Properties of Fixed Winding Space and Variable Size of Wire. Fixed Winding Space and Fixed Length of Wire or Number of Turns. Constant Internal Dimensions, but External Diameter of Coil Variable. Fixed Internal Radius and Interflange-Fixed Number of Turns of Same Size of Wire.

The Importance of Details. Actual Calculations. Working Formulæ. Diameter of Wire to Carry Given Current. Diameter of Wire to Have Given Resistance. Thickness of Insulation in a Given Coil. Weight of Copper in a Given Coil. Table of Constants for Insulated Wire. Standard Table of Resistances of Insulated Wires. Table Showing Percentage of Copper and Insulation in Cotton or Silk Covered Wire. Standard Copper Wire Table. 17 Problems (Solved) Illustrated. Cuts of 37 Magnets of Standard Dimensions, Lengths Variable. Logarithms and Anti-Logarithms. Decimal Parts of an Inch Logarithmic Scale.

If you want Wires or Cables insulated with the HIGHEST CLASS INDIA RUBBER INSULATION you should buy . . . . . .

HABIRSHAW

Complete stock of all sizes constantly on hand and for sale at lowest market prices by

CHICAGO EDISON COMPANY,

WRITE FOR PRICES. 139 ADAMS STREET, CHICAGO.

3,500

OR MORE WILL ATTEND THE

NATIONAL ELECTRIC LIGHT CONVENTION

To be Held at Denver and Colorado Springs, June 6th to 11th Inclusive

This greatest and most important convention in the history of the Association will be covered fully, completely and in a manner befitting the WESTERN ELECTRICIAN.

Being a Western convention your advertisement should appear in the only western general electrical journal—the WESTERN ELECTRICIAN; and it should correspond in size and importance with the importance of the convention and of our convention issues of June 3rd, 10th and 17th.

Write us today reserving space in a select location.

Western Electrician, 510 Marquette Bldg., Chicago

"Flexduct" is that high standard required in all high-class work. It is very flexible, a high insulation and indestructible

FLEXIBLE CONDUIT

"Flexduct" the National Code Standard. It does not deteriorate, always usable to highest degree

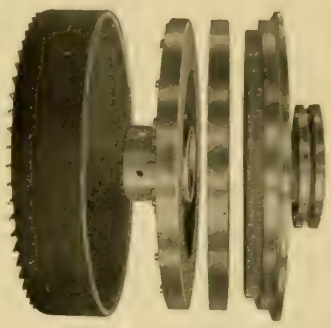
# The C-H Accelerator

## *WHAT IT IS AND WHAT IT DOES*



Parts in their proper relation. Beginning from the left-Oil Casing, Field Magnetizing Coil, and Back Plate with flange to which Oil Casing is attached.

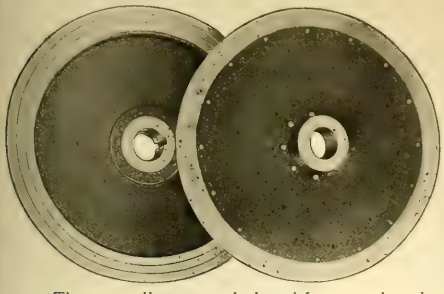
THE Cutler-Hammer Accelerator is a form of magnetic clutch, but different from any magnetic clutch thus far produced, for the reason that it will uniformly accelerate a load from rest to synchronism, run at high speeds, transmit any H. P., and take hold and release immediately.

It is dependable, durable, simple in construction, compact in size, neat in appearance, has no links nor loose parts, and runs in oil.

It can be operated from the switchboard, or any other point or points of convenience, by push buttons, and can be applied to almost any form of apparatus or condition of service.

It has ample wearing surfaces and requires no adjustment for that purpose.

It is self-oiling, the only attention required being the occasional renewing of oil in the casings, and the replacing of worn-out brushes.



The coil construction prohibits the possibility of open or short circuits, it being enclosed mechanically and thoroughly insulated electrically.

There is no guess work in this device. We have experimented, without stinting expense, for several years, and for nearly that length of time we have had practically the same device we now offer you in successful operation in our own factory.

## The C-H Magnetic Couplings

These couplings are extremely simple in construction, being composed of two steel plates, the field member of which is fitted with the energizing coil, as shown in the illustration.

When the coil circuit is closed, the plates spring together and are held by an enormous pressure. When the current is interrupted they spring apart.

These couplings were designed for use where both shafts are at rest, or where they are running at the same speed. They are applicable for power station work, for quick release to prevent accidents in mills, and for the automatic protection of machinery. The magnetizing current is small, in the larger sizes being but a fraction of 1 per cent. of the power transmitted.

They are made of the best material throughout, and special precaution is taken to guard against grounds and heating.

Send to-day for our catalogue, describing both our Accelerators and Couplings.

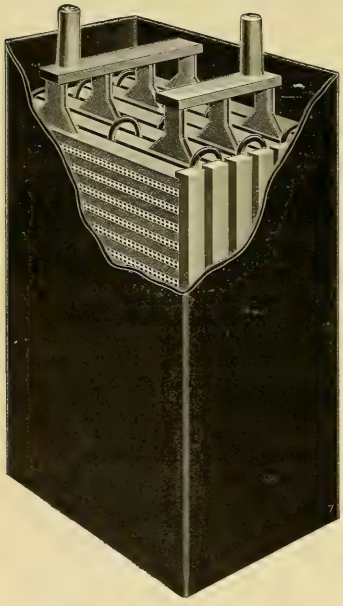
# THE NEW "MORRISON" STORAGE BATTERY

## Just What the World Has Been Waiting For.



THE CELL

**This plate is so strong electrically and mechanically that no amount of electrical abuse or of vibration in traction service can dislodge even the slightest particle of its active material.**

**Lowest internal resistance of any storage battery in the world.**

***The weight efficiency is conservatively 14 watts per pound total weight, and electrical efficiency unsurpassed.***

## CONSTANT USE OF THE C-H. FIELD REGULATOR HAS PROVEN

That the material of which its base is made does not allow grounding; that overloads do not disintegrate it; that it readily radiates and conducts heat, and is a perfect insulator. Its construction is such that no trouble can exist from small parts or contacts. Bulletin 32 explains in detail.

NEW YORK CITY

The FRANKLIN Model Shop

Not only strike while the iron is hot, but make it hot by striking.

Heat is a mode of molecular motion. The molecules of the buyer's brain can be made to move if you forcefully and persistently strike them through his eye by telling him your advertising tale in the weekly issues of the Western Electrician.

**WANTED, FOR SALE** *and similar* **WANT COLUMN** *advertisements (50 words or less), $1.50 an insertion; additional words 3c each.* **POSITION WANTED** *advertisements (50 words or less), $1.00 an insertion; additional words 2c each.*

## POSITION WANTED.

As electrician or repair man of power or lighting plant, by young man of six years' experience with motors, meters, arc lamp wiring, etc. Can furnish good reference, no objection to distance. Address BOX 465, care of Western Electrician, 510 Marquette Bldg., Chicago.

## POSITION WANTED.

By first-class steam and electrical engineer with 23 years' experience in the operation of power plants. Wishes to invest $1,000 and take position on official or operating forces in either lighting, power, manufactory or electrical machine shop; thoroughly understand handling financial and technical part of work. Strictly sober and educated. Address BOX 461, care Western Electrician, 510 Marquette Bldg., Chicago, Ill.

## POSITION WANTED.

Man of 35, thoroughly familiar with the commercial end of the electric light and power business, wants a position west of the Missouri River. Seven years in present position and can furnish A1 references. Address BOX 464, care of Western Electrician, 510 Marquette Building, Chicago.

## WANTED.

To employ in every city in the United States and Europe, a responsible, intelligent, temperate man, as agent for the sale of a no-acid, non-corrosive Soldering Flux. THE UNIVERSAL CO., 537 West 149th St., New York.

## WANTED.

Electrical engineer of unquestioned reputation and ability, one having experience in power station and lighting installations, wanted by large corporation in capacity of sales manager. Address ELECTRICAL ENERGY, P. O. Box 44, Buffalo, N. Y.

## WANTED.

Man for armature winding and general motor repair work; permanent position for right man. Address C. A. BARNEY, Kewanee, Ill.

## WANTED.

Salesmen or engineers calling on electrical engineers to sell or take orders for

**"NON-MAGNETIC WATCHES"**

Factory prices and special inducements.

**W. F. DOLL MFG. CO., 176 Broadway, New York.**

## FOR SALE.

One 25-H. P. Nash gas engine, direct-connected to 15-K. W. Crocker-wheeler dynamo can be used for 115 or 230 volts. This would be a first-class outfit for automobile charging station. GRAHAM BROS. CO., 662 Hudson St., New York City.

"WESTERN"
POLE HOLE DIGGER
Its Action is Simple and Automatic. "Just Push Down, Pull Up and Let Go"
For Electric Light Telephone and Telegraph Cos.

It operates easily at any depth—it will dig a four-foot hole with the hand lever above ground but may be used at a much greater depth. It will handle stones, discharge sticky soil and make holes of any size. On account of its driving power and ease of handling it will dig through any soil, from slush to gravel, more rapidly than any other digger made.
The regular digger, shown in the accompanying cut, will dig a five-foot hole without making it larger than the pole requires. In response to requests from prominent telephone companies in various sections of the country, we also have brought out a special telephone digger which will dig seven and eight-foot holes without increasing their diameter. It is identical in action with the one shown in the cut, except that it is provided with a longer handle and with two hand levers instead of one.

## NATIONAL STANDARD BRANCH BLOCKS...

*2 and 3 Poles*
*Single and Double*

BRANCH: 250 VOLTS, 3-60 AMPS.

BLOCKS BELOW 31 AMPS. WITHOUT LUGS.

THE fuse receiving portion of the block is substantially the same as the regular main line block arrangement. Abutting one end of this portion of the block, however, is the main line connecting portion which is provided with the necessary grooves fitted with clamp contacts for the reception and connection of the main line wires. The grooves for these are depressed below the surface so that there is ample insurance against cross-connection. The uniformity of dimension as in the case of the main line blocks gives the "National Standard" branch blocks a decided advantage.

**NOARK** National Electric Code Standard Fuse Devices, APPROVED

We make and carry in stock at all our branch stores in the United States a large and complete line of these goods and can fill your orders promptly.

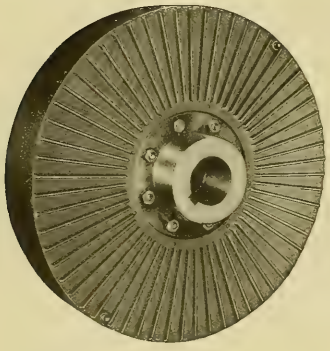
ALWAYS IN STOCK

MANUFACTURED BY
**G. I. Co.**

**CHICAGO EDISON COMPANY, 139 Adams Street, CHICAGO.**

# Our Claims and Our Proof



We claim for the Cutler-Hammer Accelerator that it will start a load gradually an smoothly, that it will release instantly, that no adjustments are necessary for wear of face that all the attention it requires is to be kept oiled and carbons replenished, and that it can b operated either automatically or by means of push buttons.

Here's evidence of it:

In the Leetsdale plant of the Riter-Conley Mfg. Co., is an accelerator connected to 100-H. P. induction motor used to drive a machine.

The motor is started in the morning and runs continuously all day.

By means of a pressure regulator the accelerator automatically starts and stops th pump from 200 to 250 times a day, using but 2 amperes of current at 110 volts.

It has been doing this for over three months, which is equal to a service under ordinar conditions of a score of years.

Notwithstanding that the accelerator has been energized over 20,000 times, no adjustment have been necessary for wear of faces, in fact it has been given no attention except to keep i supplied with oil.

Could you ask for more conclusive evidence than this?

We would like to send you catalog describing it.

# THE NEW "MORRISON" STORAGE BATTERY

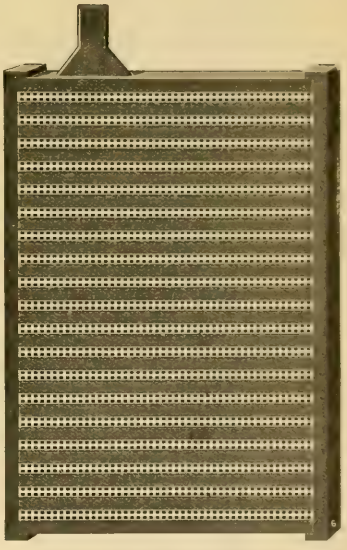
## Just What the World Has Been Waiting For.

THE CELL

This plate is so strong electrically and mechanically that no amount of electrical abuse or of vibration in traction service can dislodge even the slightest particle of its active material.

Lowest internal resistance of any storage battery in the world.

***The weight efficiency is conservatively 14 watts per pound total weight, and electrical efficiency unsurpassed.***



THE PLATE

# Universal Electric Storage Battery Co.

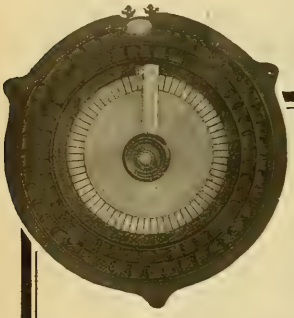
*INCORPORATED*

**Office: 1355 Railway Exchange Building**

**Factory: 36-38 Union Park Place**

**Chicago, Illinois**

# No Trouble from Loose Parts



THE current carrying parts of the Cutler-Hammer Field Regulator are solidly imbedded in the base by a compound, the nature of which causes it to become part of the base itself. This compound will not separate from the base, no matter to what degree the wires are heated. White hot wire tests have thoroughly demonstrated this fact. By such a construction the trouble incident to loose parts is eliminated.

The base itself is a perfect insulator; radiates and conducts heat properly; does not allow grounds, and will not disintegrate from overloads.

The handle is easily moved, but is not affected by jar of machinery.

For rear of board mounting we furnish an all-copper hand wheel, polished and lacquered, and insulated by a single piece of fibre.

Our convertible type is equipped with all-copper wheel on one side and a hard rubber handle on the reverse side, and can be operated from either front or rear of board.

LET US SEND YOU BULLETIN 32
WHICH DESCRIBES IT

## The Cutler-Hammer Mfg. Co.

# "ARC BURST" CLUSTER

## THE POPULAR STORE LIGHT

AND ARC LIGHT DISPLACER. TRY THEM AND CUT DOWN YOUR LIGHT BILL 25 PER CENT.

A practical grouping of highest efficiency meridian type lamps with **Benjamin Wireless Clusters** made doubly effective by reflectors, scientifically arranged to radiate and distribute perfectly all available light.

The first cost is much lower and the cost of operation is 25 to 40 per cent. less than an ordinary enclosed arc lamp, while the general effect is a steady, soft light evenly diffused, which is most agreeable to the eyes and especially applicable to effective display of colors.

**BETTER AND CHEAPER THAN ARC LAMPS**

**Economical, Reliable, Durable**

A light particularly adapted for Stores of all kinds. Art Galleries, Restaurants and all public buildings.

**NATIONAL CODE STANDARD**

# The Western Electric Light Convention

THE National Electric Light Convention to be held at Denver, June 6th, 7th and 8th and at Colorado Springs, June 9th, 10th and 11th, will be the largest and the most important in the history of the association.

The issues of the Western Electrician of June 3d, 10th and 17th will be of corresponding importance.

The issue of June 3d will be distributed at the convention and will be devoted largely to the electrical interests of Denver and Colorado Springs. It will contain portraits of leading central-station men, completely illustrated articles descriptive of commercial lighting plants, the full programme of the convention, and much other material of especial value to those interested in central-station work.

As the coming convention will be noteworthy as being the first national electrical gathering to be held so far west as Colorado, the issue of June 3d will describe the electrical interests of the Centennial State in a manner worthy of the western electrical journal.

The issues of June 10th and 17th will contain the full and complete report of the convention proceedings.

The consequent value of these three issues to the advertiser who wishes to reach the eyes of the buyers of electrical machinery and supplies is evident.

Send your order today for space of liberal size.

As this will be a *western* convention you should place your convention announcement in the Western Electrician.

When you advertise be sure—be VERY sure—that you are in the medium that reaches most thoroughly and surely the possible purchasers of your product. Then spend your money as if every dollar were a leaf, and you were the owner of boundless forests.

Don't spend it grudgingly. Don't spend it timorously. Spend it boldly, and with the absolute knowledge that advertising is an INVESTMENT which will positively build up your business by making your name, your address and your product known throughout the world of electrical buyers.

Remember that you have competitors who are up and doing, with a heart for any fate.

Don't forget that the only effective advertising is continuous advertising.

Bear in mind that advertising in the WESTERN ELECTRICIAN educates the buyers of electrical machinery and supplies, that it brings direct inquiries, and that it paves the way for calls by your road men.

**WANTED, FOR SALE** *and similar* **WANT COLUMN** *advertisements (50 words or less), $1.50 an insertion; additional words 3c each* **POSITION WANTED** *advertisements (50 words or less), $1.00 an insertion; additional words 2c each.*

## POSITION WANTED.

By first-class steam and electrical engineer with 23 years' experience in the operation of power plants. Wishes to invest $1,000 and take position on official or operating forces in either lighting, power, manufactory or electrical machine shop; thoroughly understand handling financial and technical part of work. Strictly sober and educated. Address BOX 461, care Western Electrician, 510 Marquette Bldg., Chicago, Ill.

Satisfaction guaranteed Liberal discount to dealers. Special prices to those desiring to use Flux in large quantity.

**THE UNIVERSAL CO.,**
**537 WEST 149th ST., NEW YORK**

# SAVES
# $14.00 Per 1,000 KNOBS.

Our No. 1 Insulators.

**NO TIE WIRE—NO HALF HITCH—NO WRAPPING THE KNOB—HERE'S THE SAVING:**

One tie wire measures 8 inches and 1,000 knobs take 8,000 inches—666 feet or more, depending on size of wire used, costing more than $7.00. The time spent in cutting and tying the wire costs another $5.00 per thousand at the least.

The slanting screw or nail hole on the side (see cut) makes it mere play to attach knobs to joist or studding, in one-third of the time formerly required, saving an additional $2.00 Total saving at least $14.00 per thousand knobs.

One screw does the work, too, and prevents the knob from turning.

*Ask your jobber for it or write us.*

FOR UNDERGROUND CONSTRUCTION

The American Conduit Company has a corps of experts in underground construction and is prepared to furnish supervision of work if desired. We would prefer to co-operate with contractors in underground construction, but if desired will submit estimates and bids and take contracts for completed underground systems in any part of the United States and Canada.

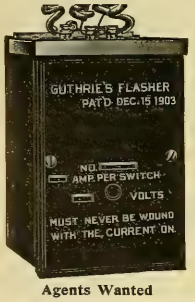
## It Can't Be Beat—The Guthrie Flasher

A SIGN FLASHER WITHOUT A MOTOR



Agents Wanted

**A FEW ADVANTAGES OF THIS FLASHER OVER ALL OTHERS:**

*First.*—The Price is lower.
*Second.*—It has fewer parts and is therefore the simplest flasher on the market.
*Third.*—It has no motor to cause trouble and consume current.
*Fourth.*—It costs nothing to operate this flasher.
*Fifth.*—It only occupies a space of 5 x 8 inches.
*Sixth.*—It can be regulated to flash any signs or show window lights in any manner desired.
Any combination of lights, without motor or cylinder.
Simplest and best on the market.
Works on any current.
The disadvantage of a flasher was the motor question.
We have overcome this and are putting out an article that meets a long felt want.

# THE SANGAMO

## A MERCURY MOTOR TYPE DIRECT CURRENT WATTMETER

**The objectionable features common to commutator type meters are entirely eliminated, and the following features are notable in**

### THE SANGAMO METER

I. MINIMUM BEARING FRICTION—The thrust of the disc shaft is UPWARD against a flat jewel, and is less than one-sixteenth ounce.

II. MAXIMUM SENSITIVENESS—All sizes will start freely on one-hundred full load. AFTER LONG SERVICE as well as when new.

III. NO COMMUTATOR OR BRUSHES—The armature is a plain copper disc submerged in mercury, and the load current passes through this and the disc.

IV. NO PERMANENT MAGNETS—The powerful shunt field acting upon the armature serves as a damping magnet, without permanent magnets being necessary.

V. SEALED TYPE, MINIMUM SIZE AND WEIGHT—The meter is sealed type, but case is easily removable if necessary. Smallest meter made, projects 4½ inches, weighs only 10½ pounds.

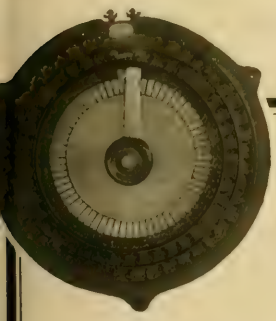
# No Trouble from Loose Parts



THE current carrying parts of the Cutler-Hammer Field Regulator are solidly imbedded in the base by a compound, the nature of which causes it to become part of the base itself. This compound will not separate from the base, no matter to what degree the wires are heated. White hot wire tests have thoroughly demonstrated this fact. By such a construction the trouble incident to loose parts is eliminated.

The base itself is a perfect insulator; radiates and conducts heat properly; does not allow grounds, and will not disintegrate from overloads.

The handle is easily moved, but is not affected by jar of machinery.

For rear of board mounting we furnish an all-copper hand wheel, polished and lacquered, and insulated by a single piece of fibre.

Our convertible type is equipped with all-copper wheel on one side and a hard rubber handle on the reverse side, and can be operated from either front or rear of board.

LET US SEND YOU BULLETIN 32
WHICH DESCRIBES IT

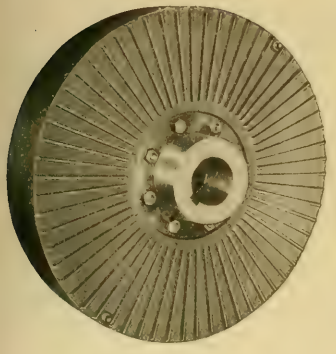
ST. PAUL (American Electric Co.) SAN FRANCISCO (California Electrical Works) CINCINNATI (Standard Electric Co.)

# Our Claims and Our Proof



We claim for the Cutler-Hammer Accelerator that it will start a load gradually and smoothly, that it will release instantly, that no adjustments are necessary for wear of faces, that all the attention it requires is to be kept oiled and carbons replenished, and that it can be operated either automatically or by means of push buttons.

Here's evidence of it:

In the Leetsdale plant of the Riter-Conley Mfg. Co., is an accelerator connected to a 100-H. P. induction motor used to drive a machine.

The motor is started in the morning and runs continuously all day.

By means of a pressure regulator the accelerator automatically starts and stops the pump from 200 to 250 times a day, using but 2 amperes of current at 110 volts.

It has been doing this for over three months, which is equal to a service under ordinary conditions of a score of years.

Notwithstanding that the accelerator has been energized over 20,000 times, no adjustments have been necessary for wear of faces, in fact it has been given no attention except to keep it supplied with oil.

Could you ask for more conclusive evidence than this?

We would like to send you catalog describing it.

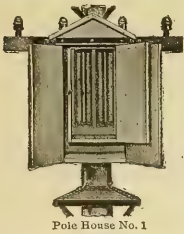
## Security Cable Pole House No. 1

THE local carpenter can make just as good a house as this if he is smart enough and has the tools, but he generally doesn't know how nor what is needed, and in no case can he compete with our machinery. These are made in cabinet style, and equal quality cannot be produced by hand at our prices. We have sold them for seven years, reducing the prices as our trade increased, and no one has been found to match them.



Pole House No. 1

These houses are dry. There are two compartments, both provided with doors, all doors closing against shoulders, and no communication is possible with the outside except through the bottom, where the cable and spider wires enter, and where joints can be and usually are made water tight.

They are suspended from iron straps which encircle them and are held by screws run into solid wood, and in no case entering the inside space.

At the bottom is an adjustable shoe, through which the cable passes. The shoe is lagged firmly to the pole, the house is then set perpendicularly and permanently bolted in place.

Eight sizes are made.

We recommend them because they are good, also cheap, and their convenience saves money, and they are permanent.

## DE - LIGHT - ED

Will we be to meet you at the convention of the National Electric Light Association to be held at Denver and Colorado Springs, June 6th to 11th.

The officers of the association say it will be the greatest electric light convention ever held, and that the indications are tht 3,500, or more, will be in attendance.

We wish to lay stress upon the fact that it will be a WESTERN convention, and that the WESTERN ELECTRICIAN will devote to the association and to the convention proceedings its issues of June 3d, 10th and 17th.

These three issues will be of permanent interest. They will be widely circulated. They will be preserved. They should contain your convention announcement. Space should be reserved now.

**WANTED, FOR SALE** *and similar* **WANT COLUMN** *advertisements (50 words or less), $1.50 an insertion; additional words 3c each.* **POSITION WANTED** *advertisements (50 words or less), $1.00 an insertion; additional words 2c each.*

## POSITION WANTED.

Single man, twenty-nine years of age, with good habits, would like position as operator, engineer or assistant. Have six years' experience in the care and operation of engines, water-wheels, A. C. and D. C. generators. Am graduate from I. C. S. in electric and steam course. Good reasons for leaving present position. Middle states preferred. Address BOX 468, care of Western Electrician, 510 Marquette Bldg., Chicago.

## POSITION WANTED.

By first-class steam and electrical engineer with 23 years' experience in the operation of power plants. Wishes to invest $1,000 and take position on official or operating forces in either lighting, power, manufactory or electrical machine shop; thoroughly understand handling financial and technical part of work. Strictly sober and educated. Address BOX 461, care Western Electrician, 510 Marquette Bldg., Chicago, Ill.

## POSITION WANTED.

With some electric company, by an all around man, with a first-class license as steam engineer. Ten years' experience with all kinds of steam and electrical apparatus. A-1 references. Address BOX 70, Deer Lodge, Montana.

## WANTED.

Man for armature winding and general motor repair work; permanent position for right man. Address C. A. BARNEY, Kewanee, Ill.

## WANTED.

Good wiremen for single and polyphase work. Three to four years' experience. Permanent positions for reliable and sober men. Apply ELECTRIC SERVICE COMPANY, 208 N. Main St., South Bend, Ind.

## WANTED.

Traveling salesman for electrical supplies in territory where trade is established. Address BOX 466, care Western Electrician, 510 Marquette Bldg., Chicago.

## WANTED.

Salesmen or engineers calling on electrical engineers to sell or take orders for

**"NON-MAGNETIC WATCHES"**

Factory prices and special inducements.

**TO THE**

National Electric Light Association Meeting at

# DENVER AND COLORADO SPRINGS

**JUNE 6, 7, 8 AND 9, 10, 11, 1905.**

For the exclusive use of delegates, supply men, their friends and ladies, the

# "BURLINGTON" R.R.,

**(C., B. & Q. R. R.)**

Operating in conjunction with the Pennsylvania R. R. has been designated by the association to run the

## *"OFFICIAL TRAIN"*

**FROM**

# CHICAGO to DENVER.

It is planned to run a special train out of New York as a second section of the Pennsylvania Limited, leaving New York some time Saturday morning, June 3rd. It is proposed to make this train in every respect a duplicate of the Pennsylvania Limited, viz., the same beautifully equipped parlor smoker, dining car, sleepers and possibly an observation car. This Pennsylvania railroad section will run through solid to Denver. At Chicago, however, the Burlington section or strictly western train, will be coupled on to the Pennsylvania or eastern section of the train, and both trains thus united will be hauled as a solid train from Chicago direct to Denver over the Burlington route. An exact schedule has not as yet been made, but it now looks as though this train would certainly arrive in Chicago sometime Sunday morning, June 4th. It is the purpose to allow several hours in Chicago for a "breathing spell." This combination train will then leave Chicago sometime the same afternoon, and it is the plan to land the entire party from the combination train in Denver, Monday afternoon, June 5th, in ample time for supper and the evening's amusement.

In view of the enthusiasm displayed relative to this western convention and the fact that all berths on the train are not "lowers," (!) those desiring to join the convention party and go West from Chicago to Denver over the Burlington should, without delay, early make reservations DIRECT, addressing **F. E. BELL,** CITY PASSENGER AGENT, BURLINGTON ROUTE, 211 S. CLARK ST., CHICAGO; who is handling all inquiries appertaining to reservations for Asst. Master of Transportation Frank L. Perry of the National Electric Light Association.

Reservations for the return trip over the Burlington may be made at Denver or at Colorado Springs.

A rate of $30.00 for the round trip has been authorized for this meeting.

For any additional information address as above, F. E. BELL, City Passenger Agent, Burlington Route, 211 S. Clark St., Chicago.

## ELECTRIC RAILWAYS

THEORETICALLY AND PRACTICALLY TREATED

BY

**SYDNEY W. ASHE**

Dept. of Electrical Engineering, Polytechnic Institute of Brooklyn, Late Instructor Electric Traction, Brooklyn Rapid Transit

AND

**J. D. KEILEY**

Electrical Engineering Dept. New York Central Railroad

**The absence of a modern treatise on electric railways, embodying all the recent developments in electric traction has encouraged the authors in the preparation of this book. Their aim has been to treat the subject exhaustively from the theoretical and practical side. Realizing the immensity of the traction field and the urgency of the demand for information on this subject, the authors have restricted their efforts in the present volume to the treatment of rolling stock, and have added thereto a chapter, treating mathematically the speed time and power curves. It is their intention, should the reception of this volume be encouraging, to follow it by succeeding volumes covering the entire field. Much information has been culled from the publications of engineering societies and other sources in an effort to include in the work the most modern of railway data. This volume treats of both direct and alternating current apparatus, is profusely illustrated, and is restricted entirely to American Railway Practice.**

CONTENTS

**Units and Measuring Instruments.**—Mechanical, Electrical. Slide Rule Planimeter. Curve Plotting.
**Train Performance.**—Speed Time Curves. Power Curves. Equipment Calculations. Indicating and Recording Instruments.
**Car Construction.**—Trolley and R. R. Tractive Force, Resistance, etc. Journals, Axles, Gears, Friction. Car Trucks, Strength, Durability, Lubrication and Testing. Control of Air, Air Pumps, Governors, etc. Brakes, Brake Apparatus, Brake Shoes. Platforms, Gates, Heating.
**Car and Train Control.**—Hand Control, Trolley, Multiple Unit Control, Sprague System. Westinghouse Pneumatic. Sprague General Electric. Westinghouse, Turret or Unit, Switch Control. General Electric Bridge System.
**Electrical Equipment.**—Series Direct Current Motor. A. C. Single Phase Motor. Single Systems.
**Electric Locomotives.**—Mining Service. Industrial Service. Trunk Line Service.
**Testing.**—Testing of Equipment. Testing of Electrical Measuring Instruments.

## Laboratory and Factory Tests IN ELECTRICAL ENGINEERING

BY

**CEO. F. SEVER**

Adjunct Professor of Electrical Engineering, Columbia University

AND

**FITZHUGH TOWNSEND**

Tutor in Electrical Engineering, Columbia University

***WITH FIGURES, DIAGRAMS AND EXAMPLES***

**CONTENTS:**

PART I—DIRECT CURRENT TESTS

Preliminary Measurements—Dynamo Operation—Motor Operation Efficiency Tests—Special Dynamo Operation

PART II—ALTERNATING CURRENT TESTS

Elementary Properties of Alternating Current Circuits—Generators—Synchronous Machines in Parallel—Tests on Transformers—Curve Tracing—Resonant Rise of Potential—Polyphase Circuits and Transformations—Tests of an Induction Motor—Rotary Converters—Induction Generator—Frequency Changer.

PART III—ELECTRICAL MEASUREMENTS

"In all the land, range up, range down,
In there ever a place so pleasant and sweet"

THE
1000
ISLANDS

There may be somewhere on the earth a more delightful region than that of the Thousand Islands, but if there is, it has not been discovered. It is as fine as the Bay of Naples with no danger of being buried in hot ashes. There are 2,000 picturesque Islands scattered along the twenty-five miles of one of the most beautiful rivers in the world. You can find out a great deal regarding it in No. 10 of the "Four-Track Series," "The Thousand Islands," of the St. Lawrence River, issued by the

# NATIONAL STANDARD BRANCH BLOCKS...

SACHS NOARK FUSE

*2 and 3 Poles*
*Single and Double*

BRANCH: 250 VOLTS, 3-60 AMPS.

BLOCKS BELOW 31 AMPS. WITHOUT LUGS.

THE fuse receiving portion of the block is substantially the same as the regular main line block arrangement. Abutting one end of this portion of the block, however, is the main line connecting portion which is provided with the necessary grooves fitted with clamp contacts for the reception and connection of the main line wires. The grooves for these are depressed below the surface so that there is ample insurance against cross-connection. The uniformity of dimension as in the case of the main line blocks gives the "National Standard" branch blocks a decided advantage.

**NOARK** National Electric Code Standard Fuse Devices, APPROVED

We make and carry in stock at all our branch stores in the United States a large and complete line of these goods and can fill your orders promptly.

"WOOD" LIGHTING AND POWER SYSTEMS

## Arc Circuit Cut-Outs

These cut-outs are designed for use on direct or alternating current series circuits of any voltage to control circuits of not over 2,500 volts.

They are exceptionally durable. In a life test one of these cut-outs was operated ten hours by a wheel and crank opening and closing a 2,500-volt 9.6-ampere circuit over 50,000 times with no evidence of injury or depreciation.

During the many years they have been in use no demand has been made for repair parts.

These "Wood" arc circuit cut-outs were specified by the Insurance Bureau of the Louisiana Purchase Exposition for all World's Fair work.

Described in Bulletin No. 1042, sent free on request.

Just What the World Has Been Waiting For.

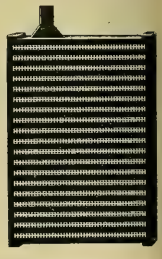
# NEW "MORRISON" STORAGE BATTERY

THE CELL

This plate is so strong electrically and mechanically that no amount of electrical abuse or of vibration in traction service can dislodge even the slightest particle of its active material.

Lowest internal resistance of any storage battery in the world.

The weight efficiency is conservatively 14 watts per pound total weight, and electrical efficiency unsurpassed . . . .



THE PLATE

UNIVERSAL ELECTRIC STORAGE BATTERY CO.

INCORPORATED

OFFICE: 1355 RAILWAY EXCHANGE BUILDING FACTORY: 36-38 UNION PARK PLACE

CHICAGO, ILLINOIS

Whitehall Bldg., N. Y. City Equipped with C.-W. Generators and Motors.

PUBLIC BUILDING without its own independent lighting and power plant is not considered modern.

Our generators are giving satisfactory service in numerous offices, public buildings and department stores.

The plant of the FIRST NATIONAL BANK Building of CHICAGO is one of our recent installations and consists of four 150-K. W. D. C. Generators which furnish current for 15,000 16-C. P. lamps and 400 H. P. of Crocker-Wheeler motors. These motors drive pumps, fans, elevators, compressors, etc.

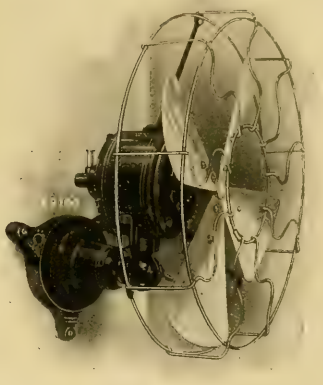
# OUR NEW "STANDARD"

1905 MODEL

## UNIVERSAL DESK OR BRACKET FANS



This is our new "Standard" Universal Desk or Bracket Fan. Combines in a single, neat and ornamental structure the desirable features of both types, as it may be mounted on either the desk or side wall, running equally well in any position. After being mounted the direction of the air current may be adjusted as desired in either a vertical or horizontal plane, then fixed in position by means of thumb screws provided for the purpose.

**ONE VALUABLE FEATURE** No tools are needed for changing from desk to bracket or for changing the direction of the air current.

Before buying send for our catalog descriptive of

# SAVES $14.00 Per 1,000 KNOBS.

Our No. 1 Insulators.

**NO TIE WIRE—NO HALF HITCH—NO WRAPPING THE KNOB—HERE'S THE SAVING:**

One tie wire measures 7 inches and 1,000 knobs take 7,000 inches or 583 feet or more, depending on size of wire used, costing more than $2.00. The time spent in cutting and tying the wire costs another $5.00 per thousand at the least.

The slanting screw or nail hole on the side (see cut) makes it mere play to attach knobs to joist or studding, in one-third of the time formerly required, saving an additional $3.00. Total saving at least $14.00 per thousand knobs.

One screw does the work, too, and prevents the knob from turning.

*Ask your jobber for it or write us.*

**Stanley-G. I. Electric Mfg. Company**

**Pittsfield, Mass.** **Chicago, Monadnock Block**

When a concern orders a piece of apparatus, gives it a thorough test under the most extreme working conditions, orders another like it, and follows that up with still another order, what does it prove?

As we told you last week, the Riter-Conley Co., of Pittsburg, bought the first Accelerator we allowed to go out. After the company had it installed for two months, starting and stopping it from 200 to 250 times a day, another was ordered. Now its order is in for a third.

A progressive firm, such as this is, does not buy on sentiment. Its first Accelerator gave results or else it would not add two more to its equipment.

If this device had not fully lived up to our claims, that it would start a load gradually and smoothly; that it would instantly release when deenergized; that the faces would not drag when one member was idle; that no adjustments had to be made for wear of faces, and that the only attention required was to keep it supplied with oil and new carbons to replace those worn out, it would not have proven a paying investment.

But it has—the duplicate orders prove it.

There is some part of your plant in which the service could be improved by the use of Accelerators. Investigate and find out where it is.

Anyway send for our catalog, which tells how the Accelerator is constructed and how it operates. It may suggest to you a solution of some control problem.

# The Western Electric Light Convention

THE National Electric Light Convention to be held at Denver, June 6th, 7th and 8th and at Colorado Springs, June 9th, 10th and 11th, will be the largest and the most important in the history of the association.

The issues of the Western Electrician of June 3d, 10th and 17th will be of corresponding importance.

The issue of June 3d will be distributed at the convention and will be devoted largely to the electrical interests of Denver and Colorado Springs. It will contain portraits of leading central-station men, completely illustrated articles descriptive of commercial lighting plants, the full programme of the convention, and much other material of especial value to those interested in central-station work.

As the coming convention will be noteworthy as being the first national electrical gathering to be held so far west as Colorado, the issue of June 3d will describe the electrical interests of the Centennial State in a manner worthy of the western electrical journal.

The issues of June 10th and 17th will contain the full and complete report of the convention proceedings.

The consequent value of these three issues to the advertiser who wishes to reach the eyes of the buyers of electrical machinery and supplies is evident.

Send your order today for space of liberal size.

As this will be a *Western* convention you should place your convention announcement in the Western Electrician.

**WESTERN ELECTRICIAN**

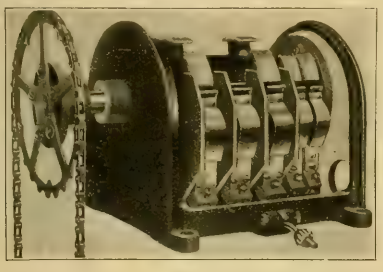
510 Marquette Building CHICAGO

# The Western Electrical Journal

A New Elevator

# Reversing Switch

For Use Only With Cutler-Hammer Self-Starters



Here's a switch that will withstand the wear and tear of elevator work, due to the constant making and breaking of the circuit.

Nothing to wear on it except the contacts, and as they are made of hard drawn copper, liberally proportioned, they will give long service. When they do wear they can be easily renewed (attached with screws) without disturbing any of the connections.

The iron drum is carefully insulated from the current carrying parts, is not affected by moisture, and consequently will not warp.

This switch can be installed in any convenient place—horizontally, vertically or on its side—no matter what the position may be, will work equally well.

It is designed to be used only in connection with C-H. self-starters and with them make ideal elevator control outfits.

Large sizes are equipped with powerful magnetic blow-outs for disrupting the arc which occurs upon opening the circuit.

We also build these switches especially for three-phase alternating-current motors, where the motor is thrown directly across the line in starting.

For dimensions and prices send for Bulletin 72B.

# It Can't Be Beat—The Guthrie Flasher

A SIGN FLASHER WITHOUT A MOTOR

Agents Wanted

**A FEW ADVANTAGES OF THIS FLASHER OVER ALL OTHERS:**

*First.*—The Price is lower.
*Second.*—It has fewer parts and is therefore the simplest flasher on the market.
*Third.*—It has no motor to cause trouble and consume current.
*Fourth.*—It costs nothing to operate this flasher.
*Fifth.*—It only occupies a space of 6 x 8 inches.
*Sixth.*—It can be regulated to flash any signs or show window lights in any manner desired.
Any combination of lights, without motor or cylinder.
Simplest and best on the market.
Works on any current.
The disadvantage of a flasher was the motor question.
We have overcome this and are putting out an article that meets a long felt want.

# BURLINGTON ROUTE

**(C., B. & Q. RY.)**

Operating in conjunction with the Pennsylvania R. R.

It is planned to run a special train out of New York as a second section of the Pennsylvania Limited, leaving New York sometime Saturday morning, June 3d. It is proposed to make this train in every respect a duplicate of the Pennsylvania Limited, viz., the same beautifully equipped parlor smoker, dining car, sleepers and possibly an observation car. This Pennsylvania Railroad section will run through solid to Denver. At Chicago, however, the Burlington section or strictly western train, will be coupled on to the Pennsylvania or eastern section of the train, and both trains thus united will be hauled as a solid train from Chicago direct to Denver over the Burlington route. An exact schedule has not as yet been made, but it now looks as though this train would certainly arrive in Chicago sometime Sunday morning, June 4th. It is the purpose to allow several hours in Chicago for a "breathing spell." This combination train will then leave Chicago sometime the same afternoon, and it is the plan to land the entire party from the combination train in Denver, Monday afternoon, June 5th, in ample time for supper and the evening's amusement.

In view of the enthusiasm displayed relative to this western convention and the fact that all berths on the train are not "lowers," (!) those desiring to join the convention party and go West from Chicago to Denver over the Burlington should, without delay, early make reservations DIRECT, addressing F. E. BELL, City Passenger Agent, BURLINGTON ROUTE, 211 S. CLARK ST., CHICAGO, who is handling all inquiries appertaining to reservations for Asst. Master of Transportation Frank L. Perry of the National Electric Light Association.

Reservations for the return trip over the Burlington may be made at Denver or at Colorado Springs.

A rate of $30.00 for the round trip has been authorized for this meeting.

For any additional information address as above

**F. E. BELL, City Passenger Agent, Burlington Route** **211 S. Clark St., CHICAGO**

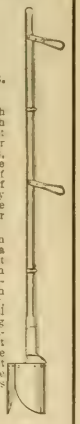
"WESTERN"
**POLE HOLE DIGGER**

Its Action is Simple and Automatic.
"Just Push Down, Pull Up and Let Go."

**For Electric Light Telephone and Telegraph Cos.**



It operates easily at any depth—it will dig a four-foot hole with the hand lever above ground, but may be used at a much greater depth. It will handle stones, discharge sticky soil and make **holes of any size.** On account of its driving power and ease of handling it will dig through any soil, from slush to gravel, more rapidly than any other digger made.

The regular digger, shown in the accompanying cut, will dig a **five-foot hole** without making it larger than the pole requires. In response to requests from prominent telephone companies in various sections of the country we also have brought out a special telephone digger which will dig **seven and eight-foot holes** without increasing their diameter. It is identical in action with the one shown in the cut, except that it is provided with a longer handle and with two hand levers instead of one.

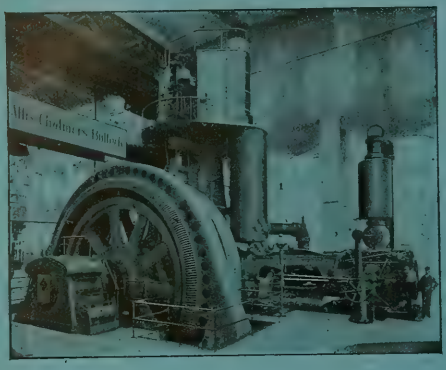
An Ideal
Central Station Unit



Single-Crank "Manhattan" Type, 5,000 Horse-power Engine
Direct-connected to a 3,500 K. W. Bullock Generator

Grand Prize, St. Louis,
1904

# Reynolds

## Horizontal-Vertical Engines

Occupies only two-thirds of the floor-space required by a horizontal cross-compound engine, and permits vertical low pressure cylinder with consequent minimum wear.

With this construction there is no liability of oil being thrown on the generator.

Especially adapted for large powers.

Bullock Electrical Apparatus
for all purposes

# Allis-Chalmers Co

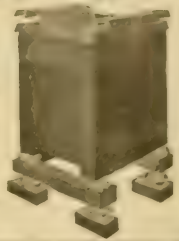
## "Chloride Accumulator"

For Central Stations, Electric Railways, Isolated Lighting and Power Stations, Fire Alarm, Telegraph, Train Lighting, etc., etc.

PRICE LISTS AND DESCRIPTIVE BULLETINS FORWARDED UPON REQUEST.

SALES OFFICES:

PHILADELPHIA, Allegheny Ave. and 19th St. | NEW YORK, 100 Broadway | BOSTON, 60 State St. | CHICAGO, Marquette Bldg. | ST. LOUIS, Walton Bldg.
SAN FRANCISCO, Rialto Bldg. | CLEVELAND, Citizen's Bldg | CANADA, Canadian General Electric Co., Ltd., Toronto



Whitehall Bldg., N. Y. City
Equipped with C.-W. Generators and Motors.

PUBLIC BUILDING without its own independent lighting and power plant is not considered modern.

Our generators are giving satisfactory service in numerous offices, public buildings and department stores.

The plant of the FIRST NATIONAL BANK Building of CHICAGO is one of our recent installations and consists of four 150-K. W. D. C. Generators which furnish current for 15,000 16-C. P. lamps and 400 H. P. of Crocker-Wheeler motors. These motors drive pumps, fans, elevators, compressors, etc.

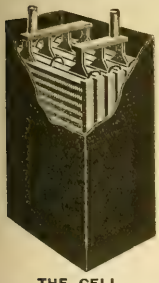
**Just What the World Has Been Waiting For.**

# NEW "MORRISON" STORAGE BATTERY



THE CELL

This plate is so strong electrically and mechanically that no amount of electrical abuse or of vibration in traction service can dislodge even the slightest particle of its active material.
Lowest internal resistance of any storage battery in the world.
The weight efficiency is conservatively 14 watts per pound total weight, and electrical efficiency unsurpassed . . . .

## UNIVERSAL ELECTRIC STORAGE BATTERY CO.

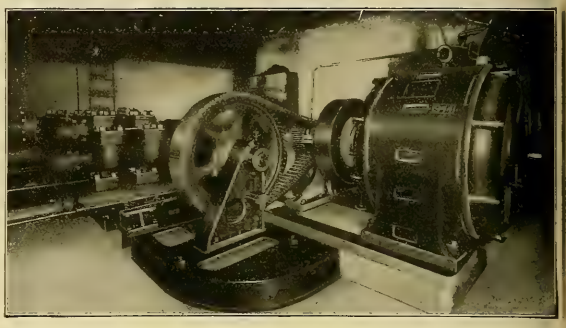
Bossert Electric Construction Co., UTICA N.Y.

## One Accelerator Is Saving $960 a Year In This Plant



In the plant shown above the Cutler-Hammer Accelerator has saved $960.00 a year in current and four-fifths of wear and tear to the apparatus to which it is connected.

Previous to the installation of the Accelerator, the apparatus was run at full speed all day, but only one-fifth of that time was it doing actually necessary work During this idle load of eight hours a day, the motor used 25 K. W. or 200 K. W. hours per day.

Since the installation of the Accelerator it has automatically started and stopped the apparatus as required, the latter remaining idle eight hours a day. While running idle the motor uses but 5 K. W. or 40 K. W. hours per day.

The saving is 20 K. W., or 160 K. W. hours per day. Figuring at the minimum rate of 2c a K. W. the saving effected is $3.20 a day, or $960 for a year of 300 days. The Accelerator cost but $350, and has saved nearly three times its cost.

This is only one instance of the saving that can be effected by the use of this device. If you have any problem of automatic control, which under the present conditions show a waste of power, submit to us what you wish to accomplish and we will figure out a way for doing it.

The Accelerator is applicable for any work where it is desired to start a load smoothly and gradually, either automatically or by push buttons.

It has no parts to get out of order and requires no attention beyond being kept supplied with oil and the replacing of old carbons.

Our catalog fully describes it. Send for it.

THE SECURITY FUSE

It has been urged that "Carbon Arresters" are a necessity, are better than our mica fuses and ground strips, that they are better understood and "the trade is educated to them," etc., etc. None of these are true unless it be the last, and if true it is perhaps our fault in not sooner calling attention to the plain fact that the line and the ground are separated, in both cases, by a mica sheet—nothing more nor less. In our design the lightning jumps from the fuse through the mica to the brass ground, and in the carbon design it jumps from one carbon through the mica to a carbon ground. Our fuse opens the circuit and must be renewed. The carbon device grounds the line permanently and must be cleaned out. We claim greater safety and convenience. A fuse is always used with the carbon, making it, the carbon, an unnecessary addition, and therefore objectionable.

Free with Security Distributing Panels. If purchased alone, $1.00 per hundred, less ten per cent for orders of five hundred.

*Write for free sample and complete catalogue No. 125 E. on Pole Line devices.*

Advertising opportunities come and go.

The wise advertiser is the one who recognizes them and seizes them.

An exceptional opportunity to place yourself and your product prominently before the world of electrical buyers will be afforded in the three great Electric Light Convention issues of the WESTERN ELECTRICIAN of June 3d, 10th and 17th.

Will you neglect this opportunity or utilize it?

The issue of June 3d will be distributed among the delegates at Denver. Copies will also be distributed on the convention special train which will leave Chicago June 4th. The issues of June 10th and 17th will contain the complete report of the convention proceedings.

All three issues will have a wide circulation among buyers of electrical machinery and supplies in every state in the union.

If you wish to seize and utilize this opportunity to obtain unlimited publicity reserve space to-day, and send copy for your announcement to-day or to-morrow.

The opportunity is going, going—and will soon be gone.

COMPETITIVE TEST OF TABULATING MACHINERY.—Beginning June 10, 1905, the Director of the Census will proceed to have a practical test made of electrical and mechanical devices for tabulating purposes, with a view to contracting for the use of such tabulating apparatus for the work of the Bureau of the Census for the fiscal year beginning July 1, 1905. All parties owning or controlling any such devices are invited to participate in this competition, the rules and regulations governing which may be obtained upon application to S. N. D. North, Director of the Census, Department of Commerce and Labor, Washington, D. C.

### NOTICE OF PROPOSAL.

Proposals for an electric-light franchise to furnish the lights for the streets, commercial houses and residences will be received by the Electric Light Committee of the City Council of the City of Aledo, Ill., a city of 2,500 inhabitants. Said proposals must be sealed and filed with the City Clerk on or before the 1st day of June, 1905, at 10 o'clock A. M.

Specifications will be furnished on application.

The city reserves the right to reject any or all proposals.

W. D. EMERSON,
City Clerk.

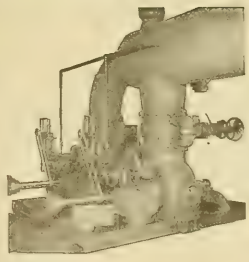
R. C. NICHOL, Com'l Agt. 242 Clark St., Chicago, Ill.



# SAMSON TURBINE

If the SPEED of the turbine is to be controlled by a GOVERNOR, the turbine should be of such capacity that it will develop the MAXIMUM POWER required, when operating at ¾ to ⅞ gate, then when an overload is thrown on the governor can open the gates wider and allow an increase in power. The EFFICIENCY of the SAMSON between ¾ and ⅞ gate is over 84%.

For the exclusive use of delegates, supply men, their friends and ladies, via

# BURLINGTON ROUTE

**(C., B. & Q. RY.)**

Operating in conjunction with the Pennsylvania R. R.

A special train will leave New York as a second section of the Pennsylvania Limited, Saturday morning, June 3d. This train will be in every respect a duplicate of the Pennsylvania Limited, viz., the same beautifully equipped parlor smoker, dining car, sleepers and an observation car. This Pennsylvania Railroad section will run through solid to Denver. At Chicago, however, the Burlington section or strictly western train, will be coupled on to the Pennsylvania or eastern section of the train, and both trains thus united will be hauled as a solid train from Chicago direct to Denver over the Burlington Route.

***The Proposed Schedule Follows:***

| | | | | | |
|---|---|---|---|---|---|
| Lv. | New York, N. Y. | 10:25 A. M., | (Eastern Time) | Saturday, June | 3 |
| " | Philadelphia, Pa. | 12:40 Noon, | " " | " " | 3 |
| " | Harrisburg, Pa. | 3:05 P. M., | " " | " " | 3 |
| " | Washington, D. C. | 10:50 A. M., | " " | " " | 3 |
| " | Baltimore, Md. | 12:00 Noon, | " " | " " | 3 |
| " | Pittsburg, Pa. | 8:15 P. M., | (Central Time) | " " | 3 |
| Ar. | Chicago, Ill. | 8:25 A. M., | - - | Sunday, " | 4 |
| Lv. | " " | 11:15 A. M., | - - | " " | 4 |
| Ar. | McCook, Neb. | 8:10 A. M., | - - | Monday, " | 5 |
| Lv. | " " | 7:10 A. M., | (Mountain Time) | " " | 5 |
| Ar. | Denver, Colo. | 2:30 P. M., | " " | " " | 5 |

It will be noted that the special train arrives in Denver Monday afternoon, June 5th, in ample time for dinner and evening's amusement in addition to giving opportunity to arrange for hotel accomodations.

Those desiring to join the convention party and go West from Chicago to Denver over the Burlington should, without delay, early make reservations DIRECT, addressing F. E. BELL, City Passenger Agent, BURLINGTON ROUTE, 211 S. CLARK ST., CHICAGO, who is handling all inquiries appertaining to reservations for Asst. Master of Transportation Frank L. Perry of the National Electric Light Association.

Reservations for the return trip over the Burlington may be made at Denver or at Colorado Springs.

A rate of $30.00 for the round trip has been authorized for this meeting and the tickets will be good not only to Denver but to Colorado Springs and Pueblo.

For any additional information address as above

**F. E. BELL, City Passenger Agent, Burlington Route** **211 S. Clark St., CHICAGO**

## PRACTICAL FEATURES OF TELEPHONE WORK.

**By A. E. DOBBS.**

**Cloth, 7 by 5 1-4 Inches. Illustrated. 134 pages. Appendix. 75 Cents.**

THIS work is designed as a simple, plain-speaking handbook for the practical telephone man. Its author, Mr. Dobbs, has been eminently fitted by fourteen years' experience in telephony to deal with the subject in a thoroughly competent manner. This he has done, and the result is a mine of information, clearly and concisely presented, and invaluable to the manager, operator and lineman alike. The appendix contains reliable data regarding wires, resistance, inductive capacity, etc.

"The Nation's pleasure ground and sanitarium."—DAVID BENNETT HILL.

THE ADIRONDACK MOUNTAINS.

The lakes and streams in the Adirondack Mountains are full of fish: the woods are inviting, the air is filled with health, and the nights are cool and restful. If you visit this region once, you will go there again. An answer to almost any question in regard to the Adirondacks will be found in No. 20 of the "Four-Track Series," "The Adirondack Mountains and How to Reach Them," issued by the
NEW YORK CENTRAL

# CENTRAL STATION HEATING

We are the originators and builders of the ONLY underground system of live and exhaust steam heating. Our system is used for the utilization and distribution of exhaust steam from electric-light and power plants, for heating residences, stores, public buildings, etc. 250 plants in successful financial and mechanical operation. We have the only practical Steam Meter. Also manufacturers of Wooden Water Pipe, Steam Pipe Casing, Steam Traps, Condensation Meters, Valves, Economizing Coils, Separators, and a full line of Steamfitters' Supplies.

# Notice to the Public.

**THE ATTENTION OF THE WESTINGHOUSE ELECTRIC AND MANUFACTURING COMPANY HAS BEEN CALLED TO THE FACT THAT CERTAIN OF ITS COMPETITORS ARE OFFERING TO SUPPLY POLYPHASE INDUCTION AND SYNCHRONOUS MOTORS, AND APPARATUS FOR USE THEREWITH, AFTER MAY 1, 1905, BECAUSE *CERTAIN OF THE TESLA MOTOR PATENTS* EXPIRE ON THAT DATE.**

**Intending purchasers of Polyphase Apparatus are hereby notified that the Westinghouse Electric and Manufacturing Company owns numerous other patents relative to these subjects, and the public is warned against infringement thereof. The Westinghouse Company will take energetic steps against makers and users of infringing devices, after May 1, 1905, as it has in the past. Its rights under its own patents, or those which it controls or under which it is licensed, must be respected.**

Attention is called to the following patents, among others, relating to alternating-current motors and systems:—

No. 416,194, to Tesla, granted December 3, 1889, induction motors.

No. 459,772, to Tesla, granted September 22, 1891, for use of induction motor as starting device for synchronous motor.

No. 487,796, to Tesla, granted December 13, 1892, for relation between number of poles on generator and on motor.

No. 445,207, to Tesla, granted January 27, 1891, for split-phase motor, sustained against Scott and Janney Electric and Manufacturing Company—opinion filed, Circuit Court, September 27, 1899.

No. 508,188, to Stanley, granted November 7, 1893, for compensated field for alternating-current motor.

No. 511,559, to Tesla, granted December 26, 1893, for split-phase method of operating motors. This patent has been sustained against the Dayton Fan and Motor Company—opinion filed, Circuit Court, February 6, 1901, and opinion filed, Circuit Court of Appeals, November 5, 1902; against Hiram C. Roberts and the Sangamo Electric Company—opinion filed, Circuit Court, September 10, 1903; against the Mutual Life Insurance Company, et al—opinion filed, Circuit Court, February 9, 1904, against the Electric Appliance Company—opinion filed, Circuit Court, March 26, 1904; against the Jefferson Electric Light Heat, and Power Company—opinion filed, Circuit Court, March 28, 1904; and against the Stanley Instrument Company—opinion filed, Circuit Court of Appeals, September 9, 1904.

No. 511,560, to Tesla, granted December 26, 1893, for split-phase means for operating motors. Sustained conjointly with 511,559 in each case.

No. 511,915, to Tesla, granted January 2, 1894, for split-phase method of operating motors. Sustained against Scott and Janney Electric and Manufacturing Company—opinion filed, Circuit Court, September 27, 1899.

No. 529,272, to Hutin & Leblanc, granted November 13, 1894, for damping device for alternating-current motors. This patent is now in suit against the Bullock Electric Manufacturing Company.

No. 553,469, to Hutin & Leblanc, granted January 21, 1896, for variable speed induction motor.

No. 469,809, to Stanley, granted March 1, 1892, for self-regulating transformer. Sustained against the Saranac Lake Electric Light Company—opinion filed, Circuit Court, April 26, 1901, opinion filed, Circuit Court of Appeals, January 14, 1902; and against the Montgomery Electric Light and Power Company—opinion filed, Circuit Court, June 18, 1904.

No. 582,132, to Lamme, granted May 4, 1897, induction motor.

No. 599,940, to Lamme, granted March 1, 1898, induction motors.

No. 609,990, to Lamme, granted August 30, 1898, starting arrangement for induction motors.

No. 609,991, to Lamme, granted August 30, 1898, starting arrangement for induction motors.

No. 610,067, to Lamme, granted August 30, 1898, induction motors.

No. 633,856, to Lamme & Mallett, granted September 26, 1899, induction motors.

No. 644,865, to Lamme, granted March 6, 1900, starting arrangement for induction motors.

No. 582,481, to Nolan, granted May 11, 1897, armature core construction. This patent is now in suit against the Bullock Electric Manufacturing Company.

No. 519,862, to Lamme, granted May 15, 1894, for starting arrangement for synchronous motors. This patent is now in suit against the Indianapolis, Shelbyville and Southeastern Traction Company.

No. 763,547, to Dusinberre, granted June 28, 1904, iuduction motors.

No. 763,379, to Dusinberre, granted June 28, 1904, induction motors.

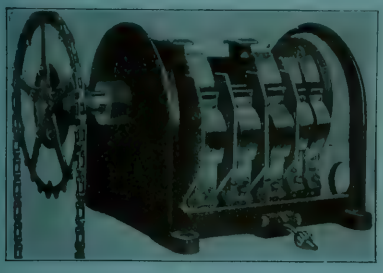
No. 759,183, to Lamme, granted May 3, 1904, alternating-current motor.

Re-issue 12,223, to Hutin and Leblanc, granted May 24, 1904, for alternating-current transformation.

A New Elevator

# Reversing Switch

For Use Only With Cutler-Hammer Self-Starters



Here's a switch that will withstand the wear and tear of elevator work, due to the constant making and breaking of the circuit.

Nothing to wear on it except the contacts, and as they are made of hard drawn copper, liberally proportioned, they will give long service. When they do wear they can be easily renewed (attached with screws) without disturbing any of the connections.

The iron drum is carefully insulated from the current carrying parts, is not affected by moisture, and consequently will not warp.

This switch can be installed in any convenient place—horizontally, vertically or on its side—no matter what the position may be, will work equally well.

It is designed to be used only in connection with C-H. self-starters and with them make ideal elevator control outfits.

Large sizes are equipped with powerful magnetic blow-outs for disrupting the arc which occurs upon opening the circuit.

We also build these switches especially for three-phase alternating-current motors, where the motor is thrown directly across the line in starting.

For dimensions and prices send for Bulletin 72B.

TALKING POINTS THAT WORK
WORKING POINTS THAT TALK

Make the Type K Meter
the Popular Wattmeter

FORT WAYNE ELECTRIC WORKS
Fort Wayne, Ind.

All Type K Wattmeters
are Popular
because

1st—They look right
2d—They register right
3d—They stay right
4th—They are tamper proof
5th—The price is right

The Multiphase Type K registers all the energy in any multiphase circuit all the time. It is easier to install and easier to read than two single-phase meters used for the same purpose.

# OUR NEW "STANDARD"

1905 MODEL

UNIVERSAL DESK OR BRACKET FANS

This is our new "Standard" Universal Desk or Bracket Fan. Combines in a single, neat and ornamental structure the desirable features of both types, as it may be mounted on either the desk or side wall, running equally well in any position. After being mounted the direction of the air current may be adjusted as desired in either a vertical or horizontal plane, then fixed in position by means of thumb screws provided for the purpose.

ONE VALUABLE FEATURE No tools are needed for changing from desk to bracket, or for changing the direction of the air current.

Before buying send for our catalog descriptive of 9 OTHER TYPES OF DESK and CEILING FANS

SACHS TRADE NOARK MAIN FUSE

# NATIONAL STANDARD BRANCH BLOCKS...

*2 and 3 Poles Single and Double*

BRANCH: 250 VOLTS, 3-60 AMPS.

BLOCKS BELOW 31 AMPS. WITHOUT LUGS.

THE fuse receiving portion of the block is substantially the same as the regular main line block arrangement. Abutting one end of this portion of the block, however, is the main line connecting portion which is provided with the necessary grooves fitted with clamp contacts for the reception and connection of the main line wires. The grooves for these are depressed below the surface so that there is ample insurance against cross-connection. The uniformity of dimension as in the case of the main line blocks gives the "National Standard" branch blocks a decided advantage.

NOARK National Electric Code Standard Fuse Devices, APPROVED

We make and carry in stock at all our branch stores in the United States a large and complete line of these goods and can fill your orders promptly.

# Preeminently the Storage Battery

It costs no more than the Cell Type.

It has comparatively, considerably more active material and occupies less space (about half that required by Cell Type).

It is far more durable—is cleaner and more economical in operation and much less expensive in cost of maintenance.

Besides, this important fact must not be overlooked: There are no annoying and destructive fumes as with the Cell Type. The gas does not escape, therefore no corrosion of adjacent pipe or iron work or even the tarnishing of bright metal work.

# The Mica Insulator Company's Basic Patent for Manufacturing Micanite Sustained

THE Mica Insulator Company, through Messrs. Kenyon & Kenyon, its solicitors, brought suit in equity in the United States Circuit Court for the District of New Jersey against the Union Mica Company, a New Jersey corporation, and John M. Lay. After submission of full proofs and arguments on both sides, the Honorable George Gray, of Delaware, U. S. Circuit Judge, has just filed an opinion holding that

The Union Mica Company and John M. Lay have infringed upon the rights of the Mica Insulator Company under the Dyer United States Patent No. 483,646, and that this patent introduced a new and valuable raw material to the art.

Copies of the complete opinion of Judge Gray will be mailed to anyone interested upon application to the Mica Insulator Company.

The following are quoted from Judge Gray's opinion:

"The expert testimony on both sides show that a substantially new material has, by the process of the patent in suit been supplied to the electrical art." * * * "The trade name 'Micanite,' given to this material by the patentee, has established for itself a recognized place in the electrical art."

---

Speaking of the Dyer process, Judge Gray refers to it as:

"The process that has so completely solved the difficulties in the way of economically and efficiently utilizing Mica."

---

"The process is thus characterized by a product unique and admittedly of the greatest utility."

---

"I have no difficulty in finding that the process of the Dyer patent in suit is unanticipated, and that it involves patentable invention."

---

"I am satisfied * * * that * * * the defendant company has been guilty of the infringement of claims 1 and 2 of the Dyer patent, as charged in the bill."

---

The Mica Insulator Company advises dealers and users of Mica insulating material to avoid purchasing mica products made in substantially the way Micanite is made. The patent has been sustained after long and expensive litigation and the Mica Insulator Co. proposes to enforce its rights under the Dyer patent against all infringers, and against all who aid and abet unauthorized manufacturers to infringe by purchasing the product of the infringement. The Dyer patent covers broadly the only process by which a material having the valuable characteristics of Micanite or a Mica product capable of being molded can be made.

# MICA INSULATOR COMPANY

**CHICAGO, 358 Dearborn St.** **218 Water St., NEW YORK**

*Our engineering department devotes its whole time to solving problems of electric motor control. Tell us what you wish to accomplish and we'll plan the way.*

# Self Starters for Large Motors

No other form of starter for the automatic control of large motors will operate so effectively as the Cutler-Hammer Multiple Solenoid.

Every contact is made with a snap and without arcing.

Steps of resistance are cut out by solenoid switches, each switch being energized in turn by a master solenoid, the latter's action being governed by a dash pot. This arrangement gives a smooth and easy start to the motor.

The opening of the main circuit is accomplished by a solenoid circuit maker and breaker, equipped with powerful blowouts for disrupting the arc.

The largest size motors can be automatically started and stopped by this system with a switch carrying not over one ampere of current, and controlled by a float switch, or small pressure regulator, or by any kind of small switch operated by hand or automatic devices.

It can be used with either reversing or non-reversing motors for operating pumps, electric elevators, cranes, hoists etc.

Send for bulletin 70 D for full description.

## The Starting Torque of the Accelerator

The Accelerator does automatically what is attempted manually in starting a load with a friction clutch.

There is bound to be jerking with the friction clutch as the operator does not know what tension to apply until his machine gives him warning. There is also bound to be considerable wear of faces, which in consequence will require repeated adjusting.

The Accelerator gets its starting torque from a magnetic drag, due to eddy currents set up in the armature member.

This drag exerts its strongest power when there is the greatest difference in speed between the two faces (at the start when one member is idle). As the driven member attains speed, this turning effort falls off, and when the two faces are revolving nearly at the same speed it disappears entirely and mechanical friction brings the driven member up to the speed of the driving member.

The start is smooth and the acceleration gradual. The wear of faces is guarded against by a film of oil on the surfaces of the plates, which also helps to dissipate any heat.

If you are obtaining indifferent results from the use of friction clutches, let us know under what conditions they are being used and and we'll demonstrate how much better the Accelerator will serve your purpose.

Anyway send for our catalog, which describes how the Accelerator is built and how it operates.

HAVE YOU or HAVE YOU NOT sent us copy for your announcement in our National Electric Light Convention issues of June 3d, 10th and 17th?

If not, why not?

You are a business man; and you are seeking business.

We mean business when we say that you should send us copy and authorize us to insert your announcement in these three important special issues if you wish to attract the attention of electrical buyers in every state in the country.

If you send copy today we can insert your ad in a good location.

In a few days it will be too late.

DO IT NOW.

**WANTED, FOR SALE** *and similar* **WANT COLUMN** *advertisements (50 words or less), $1.50 an insertion; additional words 3c each.* **POSITION WANTED** *advertisements (50 words or less), $1.00 an insertion; additional words 2c each.*

## POSITION WANTED.

Practical electrician of twelve years experience in D. C. and A. C. wishes position as electrician, in some central station or factory. Any branch of electrical work and electrical cranes. Cannot consider under $75 per month. Address BOX 476, care of Western Electrician, 510 Marquette Bldg., Chicago.

## POSITION WANTED.

As telephone lineman. Have had charge of a 100 drop switchboard with seventy-five private phones and twenty party lines. Installed for two years. Address BOX 477, care of Western Electrician, 510 Marquette Bldg., Chicago.

## POSITION WANTED.

Single young man with good habits and six years' practical experience with meters, arc lamps, motors and wiring desires a position in central station; would consider position as meter inspector; can furnish good reference. Address BOX 481, care of Western Electrician, 510 Marquette Bldg., Chicago.

## WANTED

DRAFTSMAN AND ENGINEER. Electrical graduate preferred. For power plant work. Must have some experience in design of piping, machinery, layouts, etc., and be capable of working independently. Permanent position and future for the right man. Address BOX 478, care of Western Electrician, 510 Marquette Bldg., Chicago.

## WANTED

Good, reliable young man to take charge of a small water power electric light plant. Must be good all around man. State age and experience. Address BOX 479, care of Western Electrician, 510 Marquette Bldg., Chicago.

## WANTED.

Light and power solicitor in a city of 40,000 in the Middle West. A man of good address, possessing tact, judgment and ambition. An excellent opportunity is afforded with a liberal broad-gauged concern. Write fully concerning experience. Address BOX 473, care Western Electrician, 510 Marquette Bldg., Chicago.

## WANTED.

Three traveling men, one thoroughly posted in the electric supply line, one thoroughly posted in electric railway supply line, one thoroughly posted on arc lamps. All must have actual road experience. Those posted in territory west of Pittsburg preferred. Address BOX 480, care of Western Electrician, 510 Marquette Bldg., Chicago.

### NOTICE OF PROPOSAL.

Proposals for an electric-light franchise to furnish the lights for the streets, commercial houses and residences will be received by the Electric Light Committee of the City Council of the City of Aledo, Ill., a city of 2,500 inhabitants. Said proposals must be sealed and filed with the City Clerk on or before the 1st day of June, 1905, at 10 o'clock A. M.

Specifications will be furnished on application.

The city reserves the right to reject any or all proposals.

W. D. EMERSON,
City Clerk.

COMPETITIVE TEST OF TABULATING MACHINERY.—Beginning June 10, 1905, the Director of the Census will proceed to have a practical test made of electrical and mechanical devices for tabulating purposes, with a view to contracting for the use of such tabulating apparatus for the work of the Bureau of the Census for the fiscal year beginning July 1, 1905. All parties owning or controlling any such devices are invited to participate in this competition, the rules and regulations governing which may be obtained upon application to S. N. D. North, Director of the Census, Department of Commerce and Labor, Washington, D. C.

WORKS QUICK AND EASY. KEEPS ITS LUSTER. HOLDS OLD TRADE AND MAKES NEW. DOES NOT DETERIORATE. ESTABLISHED 16 YEARS. SOLD BY AGENTS AND DEALERS ALL OVER THE WORLD

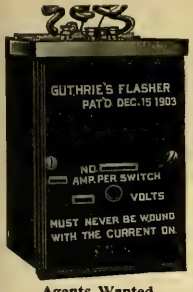
## It Can't Be Beat—The Guthrie Flasher

A SIGN FLASHER WITHOUT A MOTOR



Agents Wanted

A FEW ADVANTAGES OF THIS FLASHER OVER ALL OTHERS:

*First.*—The Price is lower.
*Second.*—It has fewer parts and is therefore the simplest flasher on the market.
*Third.*—It has no motor to cause trouble and consume current.
*Fourth.*—It costs nothing to operate this flasher.
*Fifth.*—It only occupies a space of 6 x 8 inches.
*Sixth.*—It can be regulated to flash any signs or show window lights in any manner desired.

Any combination of lights, without motor or cylinder.
Simplest and best on the market.
Works on any current.
The disadvantage of a flasher was the motor question.
We have overcome this and are putting out an article that meets a long felt want.

# SAMSON TURBINE

The illustration shows the large NIAGARA design, HORIZONTAL SHAFT TURBINES recently installed by us, for the NIAGARA FALLS HYDRAULIC POWER & MANUFACTURING CO., Niagara Falls, N. Y. Tests conducted by competent engineers, developed as follows:

| Head | Gateage | Speed | H. P. | Generator Efficiency | Turbine Efficiency |
|---|---|---|---|---|---|
| 213 ft. | ½ | 257 r. p. m. | 1750 | 95 per cent | 73.00 per cent |
| 213 ft. | ¾ | 257 r. p. m. | 3000 | 95 per cent | 85.60 per cent |
| 213 ft. | Full | 257 r. p. m. | 3500 | 95 per cent | 81.50 per cent |

These results have never been equaled by any turbine of the Horizontal Shaft Design, operating under equally HIGH HEADS. The test was made AFTER TURBINES WERE INSTALLED, direct coupled to generators. Francis' weirs and formulæ for discharge were used. The original test reports on file at our offices. These turbines are all fitted with our SAMSON BALANCED GATES. Note especially the UNIFORM SPEED at ALL GATEAGES.

# DENVER AND COLORADO SPRINGS

**JUNE 6, 7, 8 AND 9, 10, 11, 1905.**

For the exclusive use of delegates, supply men, their friends and ladies, via

# BURLINGTON ROUTE

**(C., B. & Q. RY.)**

Operating in conjunction with the Pennsylvania R. R.

A special train will leave New York as a second section of the Pennsylvania Limited, Saturday morning, June 3d. This train will be in every respect a duplicate of the Pennsylvania Limited, viz., the same beautifully equipped parlor smoker, dining car, sleepers and an observation car. This Pennsylvania Railroad section will run through solid to Denver. At Chicago, however, the Burlington section or strictly western train, will be coupled on to the Pennsylvania or eastern section of the train, and both trains thus united will be hauled as a solid train from Chicago direct to Denver over the Burlington Route.

***The Proposed Schedule Follows:***

| | | | | | |
|---|---|---|---|---|---|
| Lv. New York, N. Y. | 10:25 A. M., | (Eastern Time) | Saturday, | June | 3 |
| " Philadelphia, Pa. | 12:40 Noon, | " " | " | " | 3 |
| " Harrisburg, Pa. | 3:05 P. M., | " " | " | " | 3 |
| " Washington, D. C. | 10:50 A. M., | " " | " | " | 3 |
| " Baltimore, Md. | 12:00 Noon, | " " | " | " | 3 |
| " Pittsburg, Pa. | 8:15 P. M., | (Central Time) | " | " | 3 |
| Ar. Chicago, Ill. | 8:25 A. M., | - - | Sunday, | " | 4 |
| Lv. " " | 11:15 A. M., | - - | " | " | 4 |
| Ar. McCook, Neb. | 8:10 A. M., | - - | Monday, | " | 5 |
| Lv. " " | 7:10 A. M., | (Mountain Time) | " | " | 5 |
| Ar. Denver, Colo. | 2:30 P. M., | " " | " | " | 5 |

It will be noted that the special train arrives in Denver Monday afternoon, June 5th, in ample time for dinner and evening's amusement in addition to giving opportunity to arrange for hotel accommodations.

Those desiring to join the convention party and go West from Chicago to Denver over the Burlington should, without delay, early make reservations DIRECT, addressing F. E. BELL, City Passenger Agent, BURLINGTON ROUTE, 211 S. CLARK ST., CHICAGO, who is handling all inquiries appertaining to reservations for Asst. Master of Transportation Frank L. Perry of the National Electric Light Association.

Reservations for the return trip over the Burlington may be made at Denver or at Colorado Springs.

A rate of $30.00 for the round trip has been authorized for this meeting and the tickets will be good not only to Denver but to Colorado Springs and Pueblo.

For any additional information address as above

## SAVES $14.00 Per 1,000 KNOBS.

Our No. 1 Insulators.

NO TIE WIRE—NO HALF HITCH—NO WRAPPING THE KNOB—HERE'S THE SAVING:

One tie wire measures 8 inches and 1,000 knobs take 8,000 inches—666 feet or more, depending on size of wire used, costing more than $7.00. The time spent in cutting and tying the wire costs another $5.00 per thousand at the least.

The slanting screw or nail hole on the side (see cut) makes it mere play to attach knobs to joist or studding, in one-third of the time formerly required, saving an additional $2.00 Total saving at least $14.00 per thousand knobs.

One screw does the work, too, and prevents the knob from turning.

*Ask your jobber for it or write us.*

# THE SANGAMO

## A MERCURY MOTOR TYPE DIRECT CURRENT WATTMETER

**The objectionable features common to commutator type meters are entirely eliminated, and the following features are notable in**

### THE SANGAMO METER

I. MINIMUM BEARING FRICTION—The thrust of the disc shaft is UPWARD against a flat jewel, and is less than one-sixteenth ounce.

II. MAXIMUM SENSITIVENESS—All sizes will start freely on one-hundred full load. AFTER LONG SERVICE as well as when new.

III. NO COMMUTATOR OR BRUSHES—The armature is a plain copper disc submerged in mercury, and the load current passes through this and the disc.

IV. NO PERMANENT MAGNETS—The powerful shunt field acting upon the armature serves as a damping magnet, without permanent magnets being necessary.

V. SEALED TYPE, MINIMUM SIZE AND WEIGHT—The meter is sealed type, but case is easily removable if necessary. Smallest meter made, projects 4½ inches, weighs only 10½ pounds.

PASTE AND SALTS ALSO

"K & W" COMPOSITE DYNAMO BRUSHES, COMMUTATOR LUBRICATING COMPOUND

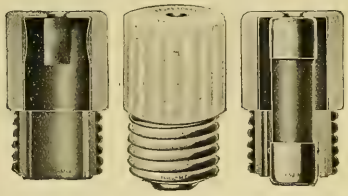
***JOHN F. WALSH CO.***

(AGENTS WANTED) (SUCCESSORS TO K. & W. CO.) PITTSFIELD, MASS.

## "NATIONAL STANDARD"

**FUSE PLUG**

250 VOLTS 3-60 AMPS.



The make up of the "National Standard" fuse plug consists of a cylindrical brass shell on one end of which the Edison Standard screw thread is formed. The other end of the shell is provided with inwardly projecting clip contacts, and on the outside of this upper end of the plug a corrugated porcelain cap is fitted and firmly secured. The screw thread end of the plug shell forms one contact. Inside of the screw thread portion is a porcelain button having annular hole. The plug is now made complete by simply inserting through the hole in the porcelain button a "National Standard" fuse of the desired capacity which is pushed directly into the clips on the inside of the upper portion of the shell. The other end of the fuse projects slightly from the porcelain button and forms the other terminal of the plug. When blown the fuse may be ejected from the plug shell by simply pushing through the small hole through the top of the porcelain cap.

(INCORPORATED)

MANUFACTURERS OF

**INSULATED CORDS**

637 University Building SYRACUSE, N. Y.

FACTORY, 419 TRACY STREET

**ELECTRICIANS PLEASE READ**

**the following test:**

SYRACUSE UNIVERSITY

Syracuse, N. Y., March 6th, 1905.

The Reed Electrical Cordage Co.
Syracuse, N. Y.

Gentlemen:—I have tested the insulation of the samples of lamp cord which you furnished me and find that both of them exceed the Underwriters' requirements of 50 megohms per mile. Both samples gave an insulation resistance of over 70 megohms per mile, 70 megohms being the limit which the sensibility of my instruments would allow me to specify. The tests were made after the cord had soaked for twenty-four hours in a saturated solution of salt.

Yours very truly,
(Signed) W. P. GRAHAM.
Department of Electrical Engineering.

**To increase our working capital we are offering a few shares of treasury stock at $25.00 per share for a limited time only. Please address secretary for further particulars.**

## "FRES-KO" SOLDERING STICK

ABSOLUTELY NON-CORROSIVE

Telephoniques! Do you realize what an absolutely "NON-CORROSIVE SOLDERING PASTE" means? It means there's no "slow poison" eating out the "life" of your mechanism—your switchboard.

FRES-KO CHEMICAL CO. - Fort Wayne, Ind.

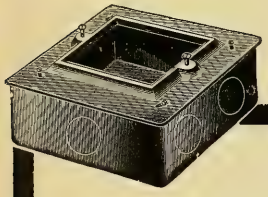
# They Won't Break



## Figure Up the Saving

That would result if you could eliminate the cost of time spent in reaming and filing and the value of the boxes broken in producing a round hole in cast iron junction boxes. You can save this money by using

## Bossert Drawn Steel Junction Boxes

They have holes with hermetically sealed plugs that can be removed with a single blow of a hammer. The result is a clean round hole without any filing or reaming. And the boxes won't break. Use them and you will be in a better position to meet competition. We also make a superior grade of

## Chicago

IT'S ON TOP AND IS GOING TO REMAIN THERE.

IT'S THE STANDARD OF AMERICA.

IT'S THE ONE THAT EVERYBODY SPEAKS WELL OF.

IT'S THE ONLY ONE HAVING FIRE-PROOF BINDING POSTS.

IT'S THE ONLY RELIABLE ONE MADE.

ITS GREAT SUPERIORITY HAS BEEN PROVEN.

IT'S THE DUNCAN.

2½ TO 10,000 AMPERES

MADE FOR ALL PRESSURES

IN USE BY 963 CENTRAL STATIONS.

HAS GREATER TORQUE THAN ANY OTHER METER IN USE.

THE ONLY ONE THAT REGISTERS ON A "HYLO" LAMP.

DON'T FORGET IT IN YOUR NEXT ORDER.

AGAIN WE SAY: IT'S THE DUNCAN.

—— o ——

## Electric Storage Batteries

**POSITIVE PLATE** + **NEGATIVE PLATE**

***Rigidity***
Has an antimoniated lead frame.

***No Buckling***
As ample room for expansion is made between each unit and conducting frame.

***Large Contact Surface***
Resulting in high capacity at high discharge rates.

***Retention of Capacity***
Because ample reserve lead is provided.

***High Capacity and Low Back Pressure***
Being of Faure type.

***Retention of Capacity***
The shape of grid holds active material in place.

***Great Conductivity***
Through peculiar rib and pin construction; also resulting in high potential at high discharge rates.

**EQUALS:**

A UNIT COMBINING THE FEATURES OF

**HIGH POTENTIAL**
**WATT EFFICIENCY**
**LONG LIFE**

***Descriptive Catalogue and Prices furnished upon application***

## The Ideal Lamp for Central Stations and Isolated Plants

A perfect burning lamp in every respect. Every part accessible for quick replacement or repair. The case, glassware and general structure are alike for all circuits. The same lamp is available for use on direct or alternating-current circuits, series or multiple, by very simple substitutions of mechanism without disturbing any part of the main structure.

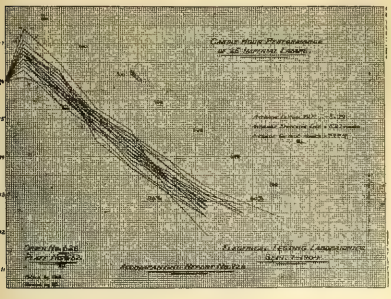
# STRAWBERRIES AND INCANDESCENT LAMPS!

Patent 537,693, April 16, '95
Patent 726,203, April 28, '03

LOOK FOR THE LICENSE LABEL IN THE STEM

Patent 444,580, Jan. 13, '91
Patent 532,760, Jan. 22, '95

**Rather peculiar isn't it to mention incandescent lamps and strawberries in the same breath? But it is all perfectly consistent because strawberries are bought by the box and incandescent lamps are bought by the box. You know how disappointed you are—or your wife or your sweetheart is—when she upsets the berries out of the box into the bowl and finds the only real good ripe ones were all on top of the box—common sense would tell you that this is the case with some lamp manufacturers, not that they put a good layer of lamps on top of the box—not at all—but they do mix 'em in and that you know very well. They take chances on your picking out of the box a good lamp for your photometric test.**



**We challenge you to test any box of Bryan-Marsh Imperial Lamps and you will find them marvelous in uniformity of life and lighting power.**

**TO ILLUSTRATE THIS SCIENTIFICALLY BY FACTS:** A very prominent lamp buyer instituted a competitive test of incandescent lamps at the Electrical Testing Laboratories in New York; five hundred Imperial Lamps were submitted.

Without going into details, the Imperial Lamps not only won the order, but the tests made at the laboratory disclosed **A MARVELOUS UNIFORMITY IN THEIR LIFE AND LIGHTING POWER.** The accompanying diagram is a reproduction of the test sheet as made out by the laboratory. Reference to the cut will show the remarkably uniform candle-hour performance.

It is needless to point out that this feature is an exceedingly valuable one for lamp buyers either large or small. **IT MEANS RELIABILITY.**

Have you ever used Imperial Lamps? **NOW IS THE TIME.**

# "THE STANDARD" FANS

TEN MODELS

THE BEST PAYING LOAD for any power station is its ELECTRIC FAN load—running all day and in many cases all night. Never varying, and in most cases running on the lighting meters. It really constitutes the ideal station business. Every well-posted manager knows this. What some of them have not yet learned, however, is that the most profitable and satisfied customers can be had by permanently adopting "The Standard" line for direct current circuits, with its ten models to select from, to suit every class and need of the trade.

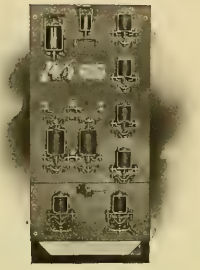
# Self Starters for Large Motors



No other form of starter for the automatic control of large motors will operate so effectively as the Cutler-Hammer Multiple Solenoid.

Every contact is made with a snap and without arcing.

Steps of resistance are cut out by solenoid switches, each switch being energized in turn by a master solenoid, the latter's action being governed by a dash pot. This arrangement gives a smooth and easy start to the motor.

The opening of the main circuit is accomplished by a solenoid circuit maker and breaker, equipped with powerful blowouts for disrupting the arc.

The largest size motors can be automatically started and stopped by this system with a switch carrying not over one ampere of current, and controlled by a float switch, or small pressure regulator, or by any kind of small switch operated by hand or automatic devices.

It can be used with either reversing or non-reversing motors for operating pumps, electric elevators, cranes, hoists etc.

Send for bulletin 70 D for full description.

# ITS FIRST COST

## A Secondary Consideration

The first cost of an Accelerator is a secondary consideration. Of course it costs more than a friction clutch, a number of times more, but it's worth 100 times more because it lasts a 100 times longer, and is 100 times less trouble.

In a certain factory in Wisconsin is a 100-H.P. friction clutch. Once a week the wooden blocks have to be renewed. In a month or two the cost of these renewals amount to as much as the first cost of an Accelerator,—and then the trouble and delay.

An Accelerator in place of that friction clutch would last years and years. It would not have to be adjusted; it would entail no expense except the cost of oil and new carbons, a cost so small that it is hardly worth considering; and it would start the machinery every time without any jerking, simply by pushing a button.

If you have a similar case, don't figure on the first cost. Take your pad and pencil and figure out the cost of repairs, the cost, bother and annoyance of delays, and estimate the saving to your machinery by proper and gradual starting.

We're anxious for an opportunity to prove to you that the Accelerator is the ideal clutch; that it is the only one on the market that has the proper principle of starting; that its construction is such that it gives no trouble, causes no delays, works equally well whether started by push buttons or automatic devices, and that when the current is turned off instantly releases.

Our catalogue will give you an idea of its construction and operation.

**WANTED, FOR SALE** *and similar* **WANT COLUMN** *advertisements (50 words or less), $1.50 an insertion; additional words 3c each.* **POSITION WANTED** *advertisements (50 words or less), $1.00 an insertion; additional words 2c each.*

## POSITION WANTED.

As superintendent or manager of an electric light plant, big contracting firm or mill. Have had years of experience, handling all types of machines and am a practical electrical mechanic familiar with all modern methods of construction, interior wiring and installing machinery maintenance and I can go at once. Address Box 482, care of Western Electrician. 510 Marquette Building, Chicago.

## POSITION WANTED.

By a high grade Bell man of twelve years practical experience who wishes to go into the independent field. Fully competent to take charge of any construction work. Past four years spent as exchange manager in their most important cities in a western state where they have strongest opposition. Address Box 483 care of Western Electrician, 510 Marquette Building, Chicago, Ill.

## WANTED.

Salesmen to sell Rock Island Dry Batteries. Commission basis only. Apply at once in writing to the Rock Island Battery Company, Rock Island, Ill.

## WANTED

Salesman in factory making gas and electrical glassware; requires the services of a first-class man accustomed to calling upon central stations, electrical supply and gas fixture trade. Good salary to satisfactory man. State previous experience, age and salary expected. Address BOX 484, care of Western Electrician, 510 Marquette Building, Chicago.

## FOR SALE.

100 second-hand 110 V., D. C. 12-inch and 16-inch fans in good condition. Columbus Public Service Co., Columbus, O.

## FOR SALE

Two hundred shares in a completely equipped electric light plant, heating and power plant, incorporated under the laws of Illinois and situated in a city of 2,500 inhabitants. The plant is thoroughly up to date, with complete duplicate equipment, is on a well-paying basis and is constantly increasing its list of customers. This stock is a controlling interest, being two-thirds of the entire stock issue of three hundred shares and the present owners of same wishing to retire from this line of business. Will sell for $3,500 on easy terms as follows: $2,500 cash, and balance secured by the stock as collateral. The actual cost of the plant is $20,000 with a bonded indebtedness of $12,000. Inspection of plant invited at any time. Address STEWARD BROS. BANK, Plano, Ill.

## NOTICE

# WINS SUIT

## Prismatic Reflector Patent Declared Valid.

**Decree in favor of O. A. Mygatt, President of Holophane Glass Company with PERMANENT INJUNCTION and ACCOUNTING against E. L. Zalinski, and the Illuminating Engineering Company.**

Following are extracts from the opinion handed down by Judge Ray of the Circuit Court of the United States, Southern District of New York, May 17, 1905:

*"The evidence fully sustains the claim of the patent.* * * * The defendant is making and selling substantially what the complainant is making and selling or is authorized by his patent to make and sell. True in some, if not all, the angle is changed; the edge is curved or beaded, and in some there are other slight changes, but these changes are evidently made to be used in justifying the infringement if possible. *The defendants' shades or reflectors are BALD APPROPRIATIONS of the complainant's patent.* Slight changes are made which add nothing to the ornamentation, but rather detract therefrom. These, however, enable the defendants to say 'our shade or reflector is different from yours, therefore we do not infringe.' * * * This cannot be so if any design patent is to be held valid.

**"The Court is of the opinion that the patent is valid and that the defendants infringe. There will be a decree for an injunction and an accounting."**

We are the owners of numerous mechanical and design patents, covering our different forms and shapes of transparent glass reflectors made on the prismatic principle, and it is our intention to prosecute all manufacturers and dealers who make or sell prismatic shades or reflectors infringing these patents.

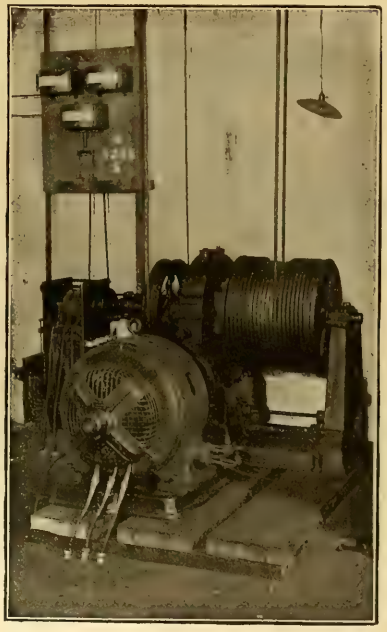
# ANNOUNCEMENT

## A SINGLE-PHASE ELEVATOR MOTOR

After many years of continuous experimental work and diligent observations of all important motor improvements in this country and abroad, we are finally able to announce the development of a PERFECT SINGLE-PHASE POWER MOTOR for Elevator and Hoist Work. This new motor promises all the advantageous torque, current and other performance characteristics of the best direct-current motors for the same class of service, and we invite immediate correspondence looking to the installation of such equipments as you may require.

We are prepared to supply on short notice motors of 10 H. P. or less capacity, for 60-cycle service, and will shortly be prepared to deliver units of 25 H. P. capacity or less for this and other frequencies.

Write for circulars and prices.



We are prepared to undertake the adaptation of this form of motor at once to the following kinds of service:

ELEVATORS
(Rope control, direct coupled or belted.)

HOISTS
of all kinds.

TRAVELING CRANES

VARIABLE SPEED DRIVE
Where 40 per cent speed regulation will be satisfactory.

# JUST READY

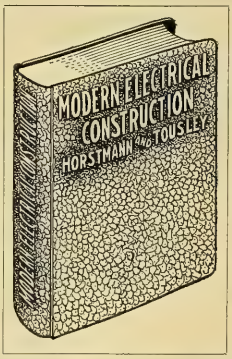
**Another Important Book for Electricians**

BY THE AUTHORS OF

MODERN WIRING DIAGRAMS AND DESCRIPTIONS.

## Modern Electrical Construction

By HENRY C. HORSTMAN & VICTOR H. TOUSLEY



This book treats almost entirely of practical electrical work. It uses the "rules and requirements of the National Board of Fire Underwriters" as a text, and explains by numerous cuts and detailed explanations just how the best class of electrical work is installed.

It is a perfect guide for the beginning electrician and gives him all the theory needed in practical work in addition to full practical instructions. For the journeyman electrician it is no less valuable, because it elaborates and explains safety rules in vogue throughout the United States. It is also of especial value to electrical inspectors, as it points out many of the tricks practiced by unscrupulous persons in the trade.

The book also contains a number of tables giving dimensions and trade numbers of screws, nails, insulators and other material in general use, which will be found of great value in practice.

There is also given a method by which the diameter of conduit necessary for any number of wires of any size can be at once determined.

The motto of the authors, "to omit nothing that *is needed*, and include nothing that is *not needed*," that has made "Wiring Diagrams and Descriptions" so successful, has been followed in this work. No book of greater value to the man who does the work has ever been published.

Pocket Size 4½ x 6½, 250 Pages, 100 Illustrations. Full Seal Leather, Round Corners, Red Edges. PRICE NET **$1.50**

Sold by Booksellers and Electrical Supply Houses generally, or sent Postpaid to any address upon receipt of price.

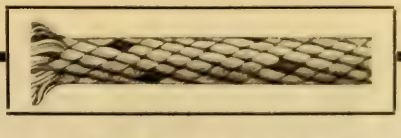
## DETROIT, MICHIGAN



# "SAMSON SPOT CORD"

***If used for hanging Arc Lamps, saves heads, lamps and expensive renewals; BECAUSE:***

FIRST—The stitches double on each other, giving freedom of play and distributing the strain equally over all the strands.

SECOND—It is made of extra quality stock, warranted free from waste.

THIRD—Being warranted free from bad splices and rough braiding, the smooth surface causes minimum abrasion and maximum wear.

For the same reasons this cord is much the most durable for Trolley Cord and Bell Cord.

We gladly send tests and samples, with full information, to all interested.

## Kellogg Express Switchboard Cabinet

The graceful Appearance comes from Simple Lines.

This Attractive Design has been so popular that it has been much copied by other manufacturers

**Fifty-Line Capacity** Quarter Sawed Oak for the entire Exterior of the Cabinet

Thoroughly seasoned wood

Finished in Light or Golden Oak

**Gold Medal** Highest Award Buffalo Exposition 1902

**Grand Prize** Highest Award St. Louis Exposition 1904

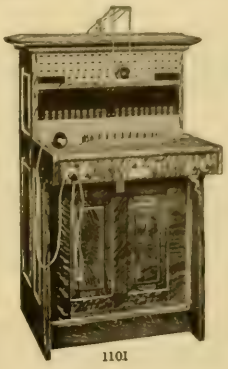
The Strongest, Longest Lived, Most Efficient Switchboards made. All telephone experts will tell you that.

**Kellogg Switchboard & Supply Co.**
**Congress & Green Streets**
**CHICAGO**
LOS ANGELES CLEVELAND PHILADELPHIA

## STROMBERG-CARLSON
### Generator Call Visual Signal Switchboard.

Has the advantage of being as rapid and costs less to maintain than a lamp signal board. Effective service at small cost.

Signals self restoring on insertion of plug in jack



1101

Key shelf is so low, operator can use an ordinary chair

This type of cabinet has all the advantages and none of the disadvantages of many boards twice its size. Bulletin sent free for the asking. Write to-day.

Western Electrician

THE DENVER AND RIO GRANDE R. R.

has more scenic attractions, mountain resorts, mineral springs, hunting and fishing grounds than any other railroad in the world.

It reaches all points of interest in Colorado and Utah.

It is the only line passing through Salt Lake City en route to and from California and North Pacific Coast.

It is the most attractive line to the Portland Exposition.

It has the highest class modern equipment and through car service.

It has a superb dining car service.

Low summer rates for the Epworth League and G. A. R. Conventions.

Write for free illustrated booklets.

## Why Not Use the Best

AND THE ONLY GENUINE

## Wrigley Patented Steele Toggle Bolt

with double flange sides and rigid back for securing brackets and fixtures to hollow tiling, marble slabs and steel ceilings. All other Toggle Bolts pivoted like cuts are infringements. The Trunnion Nut Toggle Bolt has a finished brass cap nut on the end. Hex. for wrench or round for screwdriver, plain or plated, and can be taken off after the bolt has been inserted, to place on the fixture. The bolt screws through the toggle plate the full length. Used for finished work, such as Telephones, Electric Fixtures and Marble Slabs. In ordering, mention if Trunnion Nut with Cap Nut or the plain Toggle Bolt is wanted.

# At the Convention In Denver

Look up the IMPROVED REYNOLDS AND RECO ELECTRIC SIGN FLASHER Exhibit. It will be in The Brown's Palace Hotel, in charge of Mr. I. A. Bennett.

These Flashers are creating a sensation in the electrical world by their efficiency and simplicity.

Every Central Station Man attending the convention should see this Flasher Exhibit.

These Flashers will flash from one to a thousand lamps.

No Electric sign is too large and no work too heavy for a simple little Reco Flasher to control perfectly.

You should see this exhibit. It will be well worth while.

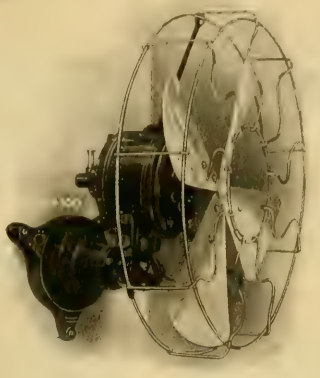
# "THE STANDARD" FANS

## TEN MODELS



THE BEST PAYING LOAD for any power station is its ELECTRIC FAN load—running all day and in many cases all night. Never varying, and in most cases running on the lighting meters. It really constitutes the ideal station business. Every well-posted manager knows this. What some of them have not yet learned, however, is that the most profitable and satisfied customers can be had by permanently adopting "The Standard" line for direct current circuits, with its ten models to select from, to suit every class and need of the trade.

# Transformer Decision Reversed

On May 3rd the United States Court of Appeals for the Southern District of New York handed down a decision in the case of the Westinghouse Electric & Mfg. Co. vs. the Montgomery Light & Power Company involving Stanley Patent No. 469,809, ***REVERSING*** a decision of the Lower Court favorable to the Westinghouse Company.

This decision of the Court of Appeals ***favorable to the Montgomery Light & Power Company*** is one step in a long line of litigation having for its object a monoply of the manufacture, sale and use of standard transformers such as used by all central station lighting and power companies.

Considerable publicity has been given the earlier decision by the Lower Court favorable to the plaintiffs, and this announcement of the reversal by the Court of Appeals will therefore dispel any misapprehension of the true merits of this litigation which may have arisen in the minds of central station people.

Users of Wagner apparatus may rest assured that this apparatus does not infringe the valid patents of other companies. It is the policy of the Wagner Company invariably to carefully investigate all the United States letters patent bearing upon its lines of manufacture, and to so design its apparatus that the patents belonging to others, valid in the opinion of our attorneys, are in no sense infringed. The wisdom of this policy is evidenced by the fact that after thirteen years of continuous manufacture of all its standard lines, there has been no patent decision against this Company or its apparatus which has stopped the manufacture of a single line of product, or inconvenienced a single customer in any way.

*The Montgomery Light & Power Company is using types "M" and "MH" transformers manufactured by this Company.*

**ELECTRICIANS PLEASE READ**

**the following test:**

SYRACUSE UNIVERSITY

Syracuse, N. Y., March 6th, 1905.

The Reed Electrical Cordage Co.
Syracuse, N. Y.

Gentlemen:—I have tested the insulation of the samples of lamp cord which you furnished me and find that both of them exceed the Underwriters' requirements of 50 megohms per mile. Both samples gave an insulation resistance of over 70 megohms per mile, 70 megohms being the limit which the sensibility of my instruments would allow me to specify. The tests were made after the cord had soaked for twenty-four hours in a saturated solution of salt.

Yours very truly,
(Signed) W. P. GRAHAM.
Department of Electrical Engineering.

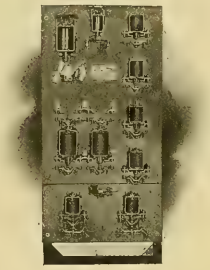
# COLUMBIA CARBONS

USED IN OVER 90% OF THE CENTRAL STATIONS IN THE U.S.

NATIONAL CARBON CO., CLEVELAND, OHIO.

*Our engineering department devotes its whole time to solving problems of electric motor control. Tell us what you wish to accomplish and we'll plan the way.*

# Self Starters for Large Motors



No other form of starter for the automatic control of large motors will operate so effectively as the Cutler-Hammer Multiple Solenoid.

Every contact is made with a snap and without arcing.

Steps of resistance are cut out by solenoid switches, each switch being energized in turn by a master solenoid, the latter's action being governed by a dash pot. This arrangement gives a smooth and easy start to the motor.

The opening of the main circuit is accomplished by a solenoid circuit maker and breaker, equipped with powerful blowouts for disrupting the arc.

The largest size motors can be automatically started and stopped by this system with a switch carrying not over one ampere of current, and controlled by a float switch, or small pressure regulator, or by any kind of small switch operated by hand or automatic devices.

It can be used with either reversing or non-reversing motors for operating pumps, electric elevators, cranes, hoists etc.

Send for bulletin 70 D for full description.

# ITS FIRST COST

## A Secondary Consideration

The first cost of an Accelerator is a secondary consideration. Of course it costs more than a friction clutch, a number of times more, but it's worth 100 times more because it lasts a 100 times longer, and is 100 times less trouble.

In a certain factory in Wisconsin is a 100-H.P. friction clutch. Once a week the wooden blocks have to be renewed. In a month or two the cost of these renewals amount to as much as the first cost of an Accelerator,—and then the trouble and delay.

An Accelerator in place of that friction clutch would last years and years. It would not have to be adjusted; it would entail no expense except the cost of oil and new carbons, a cost so small that it is hardly worth considering; and it would start the machinery every time without any jerking, simply by pushing a button.

If you have a similar case, don't figure on the first cost. Take your pad and pencil and figure out the cost of repairs, the cost, bother and annoyance of delays, and estimate the saving to your machinery by proper and gradual starting.

We're anxious for an opportunity to prove to you that the Accelerator is the ideal clutch; that it is the only one on the market that has the proper principle of starting; that its construction is such that it gives no trouble, causes no delays, works equally well whether started by push buttons or automatic devices, and that when the current is turned off instantly releases.

Our catalogue will give you an idea of its construction and operation.

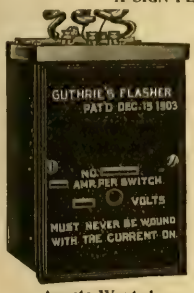
## It Can't Be Beat—The Guthrie Flasher

A SIGN FLASHER WITHOUT A MOTOR



Agents Wanted

A FEW ADVANTAGES OF THIS FLASHER OVER ALL OTHERS:

*First.*—The Price is lower.
*Second.*—It has fewer parts and is therefore the simplest flasher on the market.
*Third.*—It has no motor to cause trouble and consume current.
*Fourth.*—It costs nothing to operate this flasher.
*Fifth.*—It only occupies a space of 5 x 8 inches.
*Sixth.*—It can be regulated to flash any signs or show window lights in any manner desired.
Any combination of lights, without motor or cylinder.
Simplest and best on the market.
Works on any current.
The disadvantage of a flasher was the motor question.
We have overcome this and are putting out an article that meets a long felt want.

## ELECTRIC RAILWAYS

THEORETICALLY AND PRACTICALLY TREATED

BY

SYDNEY W. ASHE

Dept. of Electrical Engineering, Polytechnic Institute of Brooklyn, Late Instructor Electric Traction, Brooklyn Rapid Transit

AND

J. D. KEILEY

Electrical Engineering Lept. New York Central Railroad

**The absence of a modern treatise on electric railways, embodying all the recent developments in electric traction has encouraged the authors in the preparation of this book. Their aim has been to treat the subject exhaustively from the theoretical and practical side. Realizing the immensity of the traction field and the urgency of the demand for information on this subject, the authors have restricted their efforts in the present volume to the treatment of rolling stock, and have added thereto a chapter, treating mathematically the speed time and power curves. It is their intention, should the reception of this volume be encouraging, to follow it by succeeding volumes covering the entire field. Much information has been culled from the publications of engineering societies and other sources in an effort to include in the work the most modern of railway data. This volume treats of both direct and alternating current apparatus, is profusely illustrated, and is restricted entirely to American Railway Practice.**

CONTENTS

**Units and Measuring Instruments.**—Mechanical, Electrical. Slide Rule Planimeter. Curve Plotting.
**Train Performance.**—Speed Time Curves. Power Curves. Equipment Calculations. Indicating and Recording Instruments.
**Car Construction.**—Trolley and R. R. Tractive Force, Resistance, etc. Journals, Axles, Gears, Friction. Car Trucks, Strength, Durability, Lubrication and Testing. Control of Air, Air Pumps, Governors, etc. Brakes, Brake Apparatus, Brake Shoes. Platforms, Gates, Heating.
**Car and Train Control.**—Hand Control, Trolley, Multiple Unit Control, Sprague System. Westinghouse Pneumatic. Sprague General Electric. Westinghouse, Turret or Unit, Switch Control. General Electric Bridge System.
**Electrical Equipment.**—Series Direct Current Motor. A. C. Single Phase Motor. Single Systems.

# NOW

Send in your order and copy for an attractive advertising announcement for the WESTERN ELECTRICIAN'S FINAL NATIONAL ELECTRIC LIGHT CONVENTION REPORT ISSUE, to be dated June 17th.

The meeting was the largest and most important ever held and the WESTERN ELECTRICIAN'S report will be read with the greatest interest by every electrical man.

This number will go to press June 14th.

FORWARD COPY TO-DAY.

# BARGAINS IN SHELF-WORN BOOKS

You may have been looking for some of these volumes for years. Now you can get them and get them at a bargain, too.
We have only one or two copies of each of the following:

| | List Price | Sale Price |
|---|---|---|
| ELECTRICITY AS A MOTIVE POWER, by Count Th. du Moncel, London, 1883.. | $3.00 | $1.80 |
| DECORATIVE ELECTRICITY, by Mrs. J. E. H. Gordon, London, 1891..... | 2.50 | 1.50 |
| ELECTRICAL APPLIANCES OF THE PRESENT DAY, by Major D. P. Heap, U. S. A., being a report of the Paris Electrical Exhibition of 1881..... | 2.00 | 1.20 |
| TABLES AND MEMORANDA FOR ELECTRICAL ENGINEERS, by Frederick Walker, C.E. | .80 | .45 |
| MAGNETISM AND ELECTRICITY, by R. Wormell ..... | 1.25 | .75 |
| STEAM HEATING DATA, by Wm. J. Baldwin, N. Y., 1897..... | .50 | .30 |
| THE TELEGRAPHIST'S GUIDE: THE NEW EXAMINATIONS OF TECHNICAL TELEGRAPHY, by Jas. Bell, A. I. E. E., London, 1895 ..... | .50 | .30 |
| THE MECHANICAL ARTS SIMPLIFIED, by D. H. Dixon, Chicago, 1897..... | 2.50 | 1.60 |
| ELECTRIC LIGHTING, translated from the French of Count du Moncel, by Robt. Routledge, B. S. C., London, 1883... | 1.25 | .75 |
| THE ARITHMETIC OF THE STEAM ENGINE, by E. Sherman Gould, N. Y., 1897 ..... | 1.00 | .60 |
| TIPS TO INVENTORS, by Robt. Grimshaw, Ph. D., N. Y., 1893..... | 1.00 | .60 |
| MECHANICAL GRAPHICS, by Geo. Halliday, London, 1889 ..... | 2.00 | 1.20 |
| PHYSICAL UNITS, by Magnus Maclean, D. Sc. ..... | 1.00 | .60 |
| THE INDICATOR AND DYNAMOMETER, by Thos. J. Main, M. A., Philadelphia, 1893 ..... | 1.50 | .90 |
| HOW TO WORK AND FIX A DYNAMO-ELECTRIC MACHINE, by W. C. Mountain.. | .35 | .20 |
| THE INDICATOR HANDBOOK, by Chas. N. Pickworth ..... | .75 | .45 |
| THE HISTORY AND PROGRESS OF THE ELECTRIC TELEGRAPH, by Robt. Sabine, C. E., London, 1869. Cloth... | 1.25 | .75 |
| Paper ..... | .75 | .25 |
| LOCAL DISTRIBUTION OF ELECTRIC POWER IN WORKSHOPS, by Ernest Kilburn Scott, A. I. E. E. ..... | .50 | .30 |
| BEARINGS AND LUBRICATION, by A. J. Wallis-Taylor, C. E. ..... | 1.50 | .90 |
| FIRST PRINCIPLES OF MECHANICAL ENGINEERING, by Imray & Biggs, London ..... | 1.00 | .60 |
| ELECTRICITY IN OUR HOMES AND WORKSHOPS, by Sidney F. Walker, London, 1889 ..... | 1.50 | .90 |
| ELECTRICITY IN THE SERVICE OF MAN, by R. Wormell, D. Sc., M. A., New York, 1890 ..... | $3.00 | $1.80 |
| THE MATHEMATICAL THEORY OF ELECTRICITY AND MAGNETISM, by Watson & Burbury, London, 1885. Vol I, Electrostatics ..... | 2.75 | 1.65 |
| Vol. II, Magnetism and Electrodynamics ..... | 2.60 | 1.60 |
| CHAPTERS ON ELECTRICITY, by Samuel Sheldon, Ph. D. ..... | 1.10 | .65 |
| ELECTRICITY, ITS THEORY, SOURCES AND APPLICATION, by John T. Sprague, London, 1892 ..... | 6.00 | 3.60 |
| MAGNETISM AND ELECTRICITY, by H. C. Tarn, M. C. P., London, 1889..... | .80 | .45 |
| ELECTRICITY UP TO DATE, by John B. Verity, M. I. E. E., London, 1896.. | 1.00 | .60 |

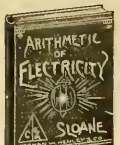
**ELECTRICIAN PUBLISHING CO., 510 MARQUETTE BLDG., CHICAGO**



Tenth Edition. Just Published.

## ELECTRICITY SIMPLIFIED

By PROF. T. O'CONOR SLOANE

158 Pages. Fully Illustrated. PRICE, $1.00

**Contents**

CHAPTER I. The Ether; Electricity; Force and Energy; Mass and Weight. CHAPTER II. The Electric Charge; Potential; The Dielectric; Positive and Negative Electricity; Contact Action; Electrostatic Lines of Force; The Leyden Jar.
CHAPTER III. The Electric Current and Circuit; Relations of Electromotive Force, Resistance and Current; Velocity of Electricity.
CHAPTER IV. Fundamental Units and the Relations Between Electrostatic and Electromagnetic Units; Practical Units; the Volt, Ohm, Coulomb and Ampere; Electric Force, Work and Energy; Chemistry of the Current.
CHAPTER V. The Magnetic Circuit and Electromagnetic Lines of Force; Magnet and Ampere's Theory.
CHAPTER VI. Electromagnetic Induction and Action of Currents Upon Each Other; The Induction Coil and Its Application.
CHAPTER VII. The Galvanic Battery; The Electrotype and the Locus of Its Potential Difference; Polarization and Local Action; Different Examples of Batteries; The Arrangement and Action of Batteries; Storage Batteries.
CHAPTER VIII. Dynamos; Motors; Transmission of Power.
CHAPTER IX. The Telephone and Microphone; Electric Lighting; The Electric Telegraph; The Dangers of Electricity; Conditions for receiving a Fatal Shock.

Sixteenth Edition. Just Published.

## ARITHMETIC of ELECTRICITY

By PROF. T. O'CONOR SLOANE

165 Pages. Illustrated. PRICE, $1.00

**Contents**

CHAPTER I. Introductory. CHAPTER II. Ohm's Law CHAPTER III. Resistance and Conductance. CHAPTER IV. Potential Difference. CHAPTER V. Circular Mils. CHAPTER VI. Special Systems. CHAPTER VII. Work and Energy. CHAPTER VIII. Batteries. CHAPTER IX. Electro-Magnets, Dynamos and Motors. CHAPTER X. Demonstration of Rules. CHAPTER XI. Notation in Power of Ten. Tables.

## Standard Electrical Dictionary

By PROF. T. O'CONOR SLOANE

682 Pages. 393 Illustrations. PRICE, $3.00

**An Entirely New Edition, Brought Up To Date and Greatly Enlarged. Complete—Concise—Convenient.**

A practical handbook of reference, containing definitions of about 5,000 distinct words, terms and phrases.
The work is absolutely indispensable to all in anyway interested in electrical science, from the higher electrical expert to the everyday electrical workman. In fact it should be in the possession of all who desire to keep abreast with the progress of this branch of science.

Fifteenth Edition. Just Published.

## ELECTRIC TOY MAKING

**DYNAMO BUILDING and ELECTRIC MOTOR CONSTRUCTION**

By PROF. T. O'CONOR SLOANE

185 Pages. Very Fully Illustrated. PRICE, $1.00.

**Contents**

CHAPTER I. Batteries. CHAPTER II. Permanent Magnets. CHAPTER III. Electro-Magnets. CHAPTER IV. Electric Motors. CHAPTER V. Electric Bells. CHAPTER VI. Miscellaneous Toys. CHAPTER VII. Spark and Induction Coils, and Allied Subjects. CHAPTER VIII. Hand-Power Dynamo. CHAPTER IX. Miscellaneous Receipts and Formulæ.

Twelfth Edition. Just Published.

## How to Become a Successful ELECTRICIAN

By PROF. T. O'CONOR SLOANE

200 Pages. Illustrated. PRICE, $1.00

**Contents**

CHAPTER I. Introductory. CHAPTER II. Mathematics. CHAPTER III. Physics. CHAPTER IV. Chemistry. CHAPTER V. Electricity at Home. CHAPTER VI. Mechanical Engineering. CHAPTER VII. Drawing. CHAPTER VIII. Teachers. CHAPTER IX. Electrical Factory Work for Students. CHAPTER X. College Education. CHAPTER XI. Steam Engineering CHAPTER XII. The Manufacturing Engineer. CHAPTER XIII. The Constructing Engineer. CHAPTER XIV. The Station Engineer. CHAPTER XV. Inventing. CHAPTER XVI. Original Investigation. CHAPTER XVII Success. CHAPTER XVIII. Reading. CHAPTER XIX. Ethics.

# As Sure As The Sun

# Edison Primary Batteries

Formerly Edison-Lalande

One of their distinctive features is the sure and constant current delivery. They are so constructed that internal resistance grows less with use, polarization is completely obviated, and they work at full strength until all the energy of every element is exhausted. It will pay you to investigate their other points of superiority. Write for booklet No. 7.

## EDISON MFG. CO.

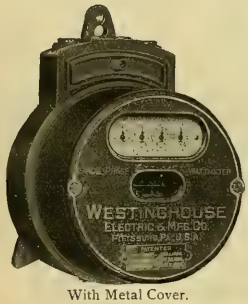
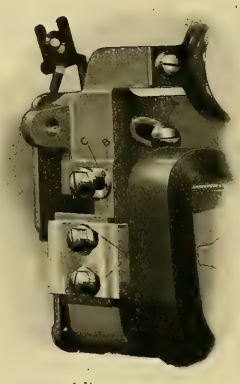
# Westinghouse

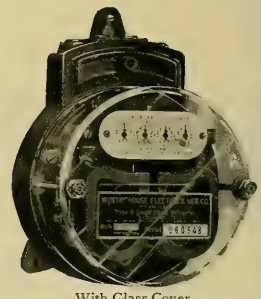
## Type "B" Integrating Wattmeter



With Metal Cover.



Adjustments:
A. Friction Adjustment.
B. and C. Frequency Adjustment.
D. Permanent Magnet Adjustment.



With Glass Cover.

### Easy to Install

The fact that the Type B Meter is a sealed meter makes it easy to install. Other meters require releasing of the moving element before being placed in service. The mechanism of the Type B is adjusted at the factory ready for use, and is placed in service just as it leaves the hands of the inspector. Any lineman who can make proper connections, and take initial reading, can place the meter in service.

### Easy to Adjust

If by any accident the calibration of the Type B Meter is destroyed it can readily be readjusted by moving the slide which will give the adjustment desired. The center illustration shows these adjustments (see letters A B C D). It will be noted they are all mechanical sliding adjustments, secured by set screws, which can be easily reached by removing the cover. There are no soldered adjustments, with danger of damage from acid fumes.

**We Have Some Interesting Wattmeter Literature; Write for it.**

Chicago, New York, Atlanta

## THE CONVENTION IS OVER

Everyone who saw the Reco and Improved Reynolds Flashers at the Denver convention pronounced them perfect.

Everyone was surprised to know that such perfect running Flashers could be built with so few working parts.

There is nothing delicate or fragile about these Flashers.

They are made heavy and strong and handle their work with absolute certainty.

Those who saw this exhibit know why we make and sell more Flashers than all others combined.

There is a reason.

Let us send you our illustrated folders. They are free.

**Reynolds Electric Flasher Manufacturing Co.**

221 Fifth Ave., Chicago, U. S. A.

Whitehall Bldg., N. Y. City Equipped with C. W. Generators and Motors.

PUBLIC BUILDING without its own independent lighting and power plant is not considered modern.

Our generators are giving satisfactory service in numerous offices, public buildings and department stores.

The plant of the FIRST NATIONAL BANK Building of CHICAGO is one of our recent installations and consists of four 150-K. W. D. C. Generators which furnish current for 15,000 16-C. P. lamps and 400 H. P. of Crocker-Wheeler motors. These motors drive pumps, fans, elevators, compressors, etc.

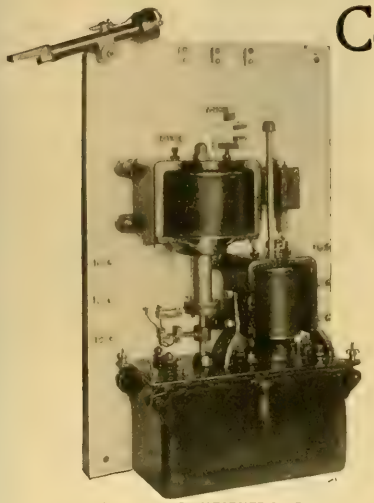
Notice What We Claim for our Automatic Controller for Induction Motors



50 H. P. AUTO-TRANSFORMER STARTER.

Absolute control of motor by temperature changes, pressure variations, time movements or water level float switches. This device offers a solution to many problems heretofore unsolved. It increases production, decreases operating expenses. Apparatus protected by overload and no voltage release devices.

We also manufacture Drum Type Controllers, Solenoids, Solenoid Switches, etc.

Our Solenoid Switch is the only alternating current switch on the market that both opens and closes automatically.

# IT IS RATHER ODD

## To Place This Lamp and "This" Side by Side!

But really it will not seem so strange when we tell you that "THIS" is not a "freak" picture—on the contrary it represents the ramifications of the nerve system of the human body and serves well to remind us that when you look at a thing *outside* you cannot tell about its *insides.* "A man's a man," is all right, and "a lamp's a lamp" *would be* all right if 'twasn't all wrong. You must *test* both men and lamps—get into them, as it were—and then in the case of the lamp you'll find out what "THIS" No. 2 really means and THIS ("too") 3

# "Banner Betterness"

means if you look into the "nerves" or "lamp insides" with a photometer you'll see why we "play" so strong on that big type expression above—"Banner Betterness" simply means we *court* your photometric test—we beg you to test—because *if* you test

THIS STANDS FOR QUALITY

NOBLAC

# INSPECTION

Every NOBLAC Inner Globe that reaches the buyer of inner globes has successfully got past a small army of testers and inspectors employed by us.

These men are not hired for their short-sightedness nor inexperience.

We look at it this way—imperfect globes that go into the cull barrel cost money; imperfect globes that reach *you* cost *customers*.

We don't mind losing a little money; we do strenuously object to losing customers.

We are inclined to think that our care in these matters is not misspent energy.

The fact that three-fourths of the inner globes used in this country are NOBLAC Inner Globes is, in our minds, partly due to our system of rigid inspections.

Our HEAT RESISTING NOBLAC gives *50 per cent longer life* than ordinary globes.

# Self Starters for Large Motors

No other form of starter for the automatic control of large motors will operate so effectively as the Cutler-Hammer Multiple Solenoid.

Every contact is made with a snap and without arcing.

Steps of resistance are cut out by solenoid switches, each switch being energized in turn by a master solenoid, the latter's action being governed by a dash pot. This arrangement gives a smooth and easy start to the motor.

The opening of the main circuit is accomplished by a solenoid circuit maker and breaker, equipped with powerful blowouts for disrupting the arc.

The largest size motors can be automatically started and stopped by this system with a switch carrying not over one ampere of current, and controlled by a float switch, or small pressure regulator, or by any kind of small switch operated by hand or automatic devices.

It can be used with either reversing or non-reversing motors for operating pumps, electric elevators, cranes, hoists etc.

Send for bulletin 70 D for full description.

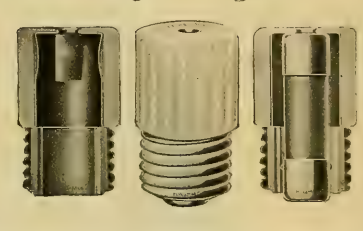
# "NATIONAL STANDARD"

## FUSE PLUG

250 VOLTS — 3-60 AMPS.



The make up of the "National Standard" fuse plug consists of a cylindrical brass shell on one end of which the Edison Standard screw thread is formed. The other end of the shell is provided with inwardly projecting clip contacts, and on the outside of this upper end of the plug a corrugated porcelain cap is fitted and firmly secured. The screw thread end of the plug shell forms one contact. Inside of the screw thread portion is a porcelain button having annular hole. The plug is now made complete by simply inserting through the hole in the porcelain button a "National Standard" fuse of the desired capacity which is pushed directly into the clips on the inside of the upper portion of the shell. The other end of the fuse projects slightly from the porcelain button and forms the other terminal of the plug. When blown the fuse may be ejected from the plug shell by simply pushing through the small hole through the top of the porcelain cap.

# The Accelerator is the Sole Exception

Every clutch ever made with the sole exception of the Accelerator depends entirely on friction for a starting torque.

The Accelerator gets most of its starting torque from induction—a magnetic drag that exerts its greatest strength at the start, thus using the least friction at the point where every other clutch experiences the most friction and consequently receives the most wear.

There is an elasticity to this drag. Just enough give to it to make a smooth, easy start.

The wearing surfaces of the Accelerator consist of a face of cast iron against a composite face of steel and babbitt. These faces are entirely immersed in oil which is not squeezed out until induction has fallen off. Wearing friction does not set in, until the two faces are revolving at almost the same speed.

These are the reasons why the Accelerator will last for years and years without any adjustment of faces.

Book One tells of the other qualities of the Accelerator which make it the ideal clutch. Why not send for it today?

June 20th, 21st and 22d is the time when, and the Auditorium Hotel, Chicago, is the place where the National-Interstate Independent Telephone Association will hold its annual convention.

This will be the first convention of the consolidated associations, and 15 states will be represented.

The issue of the Western Electrician of June 24th will contain much matter of practical value to those interested in telephony, and will be distributed at the convention.

The issue of July 1st will contain the convention report.

Both issues will be of more than ordinary advertising value to manufacturers of telephone apparatus and supplies.

**WANTED, FOR SALE** *and similar* **WANT COLUMN** *advertisements (50 words or less), $1.50 an insertion; additional words 3c each.* **POSITION WANTED** *advertisements (50 words or less), $1.00 an insertion; additional words 2c each.*

## POSITION WANTED

Good all around electric light and railway man. Would accept position in construction but central station operation preferred. Employed at present but could consider good position at once. Address BOX 488 care Western Electrician, 510 Marquette Bldg., Chicago, Ill.

## POSITION WANTED

By an electrician well experienced in all kinds of electrical work, modern construction and repair work, etc. Ten years as an electrical engineer, having been licensed I will engage with some electric lighting company or power plant. I will be open for steady position most any time. Address BOX 489, Care Western Electrician, 510 Marquette Bldg., Chicago, Ill

## WANTED

A good inside wireman and must be able to calibrate and read meters. Steady position. State salary expected. Address BOX 490, care Western Electrician, 510 Marquette Building, Chicago.

## WANTED

In an Iowa electric light plant, competent engineer for station work. Must furnish references; state salary expected, experience, etc. Address BOX 487 care of Western Electrician 510 Marquette Bldg. Chicago, Ill.

## WANTED

Salesmen to sell Rock Island Dry Batteries. Commission basis only. Apply at once in writing to the Rock Island Battery Company, Rock Island, Ill.

## WANTED

Two draftsmen experienced on telephone apparatus. State age, education or experience or call in person. WESTERN ELECTRIC COMPANY, 242 South Jefferson Street, Chicago

## FOR SALE

An electric light plant in central New York. Street lighting contract and good business established. For particulars address M. C. E., No. 602 So. Warren St., Syracuse, N. Y.

## FOR SALE

Two hundred shares in a completely equipped electric light plant, heating and power plant, incorporated under the laws of Illinois and situated in a city of 2,500 inhabitants. The plant is thoroughly up to date, with complete duplicate equipment, is on a well-paying basis and is constantly increasing its list of customers. This stock is a controlling interest, being two-thirds of the entire stock issue of three hundred shares and the present owners of same wishing to retire from this line of business, will sell for $3,500 on easy terms as follows: $2,500 cash, and balance secured by the stock as collateral. The assets of the plant is $20,000 with a bonded indebtedness of $12,000. Inspection of plant invited at any time. Address STEWARD BROS. BANK, Piano, Ill.

# "THE FOUR-TRACK SERIES"

This is the title of a series of books of travel and education issued by the Passenger Department of the **NEW YORK CENTRAL LINES**

These small books are filled with information regarding the best mode of travel and the education that can best be obtained by travel.

They relate specifically to the great resorts of America—to trips to the islands of the sea and around the world.

They also contain numerous illustrations and new and accurate maps of the country described.

"A copy of the 52-page illustrated Catalogue of the "Four-Track Series" will be sent free upon receipt of postage stamp by George H. Daniels, General Passenger Agent, New York Central & Hudson River Railroad, Grand Central Station, New York.

have recently perfected and are now selling a

## NEW TYPE OF INDUCTION MOTOR

embodying many improvements and modifications. The parts are judiciously proportioned so that in addition to other advantages a considerable reduction in weight has been effected. A perfect circulation of air through parts where most needed insures the maintenance of low temperature in operation. The motor is arranged for mounting on an iron base, in such a way that it can be operated on the floor, wall, or ceiling without any adjustment other than the changing of oil reservoirs. A single screw in the iron base serves to tighten or loosen the belt on the pulley. For further information send for our Bulletin No. 146.

CUT SHOWING METHOD OF HEATING COPPER WITH ALCOHOL CUP

## The "R-F" Soldering Copper

(Patented Jan. 17, 1905)

This is an entirely new device of great merit and usefulness to Electricians, Telephone Repair Men and Mechanics who have use for a small soldering copper that can be heated in a few minutes by the use of the alcohol cup which is shown raised in operation in illustration. A small quantity of alcohol will heat the copper so that any ordinary job may be done without the inconvenience of starting a plumber's fire pot, gasoline torch, or the use of a gas jet. This handy little tool is entirely self contained and complete in itself, the handle being so made that it holds the copper upright while heating, and when in use alcohol cup may be set back out of the way. The Soldering Copper is about four times as large as the illustration. It stands complete seven and one-half inches high on a table and weighs about four ounces. There is no other soldering copper like this unique device which has now for the first time been placed on the market.

**ELECTRICIAN PUBLISHING CO., 510 MARQUETTE BLDG., CHICAGO**

Whitehall Bldg., N. Y. City Equipped with C.-W. Generators and Motors.

PUBLIC BUILDING without its own independent lighting and power plant is not considered modern.

Our generators are giving satisfactory service in numerous offices, public buildings and department stores.

The plant of the FIRST NATIONAL BANK Building of CHICAGO is one of our recent installations and consists of four 150-K. W. D. C. Generators which furnish current for 15,000 16-C. P. lamps and 400 H. P. of Crocker-Wheeler motors. These motors drive pumps, fans, elevators, compressors, etc.

# THE NEW "MORRISON" STORAGE BATTERY

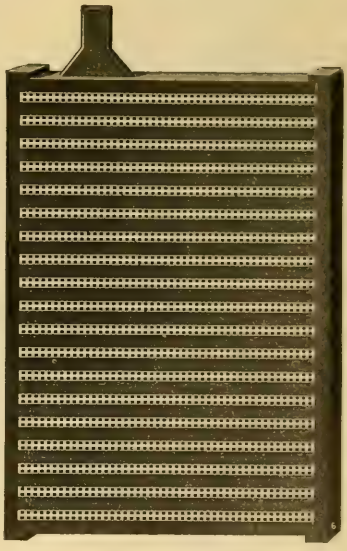
## Just What the World Has Been Waiting For.

THE CELL

This plate is so strong electrically and mechanically that no amount of electrical abuse or of vibration in traction service can dislodge even the slightest particle of its active material.

Lowest internal resistance of any storage battery in the world.

***The weight efficiency is conservatively 14 watts per pound total weight, and electrical efficiency unsurpassed.***



THE PLATE

# The Reed Electrical Cordage Company
(INCORPORATED)

MANUFACTURERS OF
**INSULATED CORDS**

**637 University Building SYRACUSE, N. Y.**

FACTORY, 419 TRACY STREET

**ELECTRICIANS PLEASE READ**
the following test:

SYRACUSE UNIVERSITY
Syracuse, N. Y., March 6th, 1905.

The Reed Electrical Cordage Co.
Syracuse, N. Y.

Gentlemen:—I have tested the insulation of the samples of lamp cord which you furnished me and find that both of them exceed the Underwriters' requirements of 50 megohms per mile. Both samples gave an insulation resistance of over 70 megohms per mile, 70 megohms being the limit which the sensibility of my instruments would allow me to specify. The tests were made after the cord had soaked for twenty-four hours in a saturated solution of salt.

Yours very truly,
(Signed) W. P. GRAHAM.
Department of Electrical Engineering.

**To increase our working capital we are offering a few shares of treasury stock at $25.00 per share for a limited time only. Please address secretary for further particulars.**

# Of Interest to Central Stations

More Electric Signs mean MORE current CONSUMED.

More current consumed means MORE MONEY to you.

Hundreds of merchants WANT electric signs but the cost of current SCARES them.

By selling Reco or Improved Reynolds Flashers with electric signs, many merchants can be interested who could not be interested before, because these Flashers reduce the expense of current 40% and at the same time make the sign 10 times as attractive.

NOW is the TIME to sell Signs and Flashers.

May we send full particulars and price about RECO and Reynolds Flashers?

Write us to-day.

**WESTON** ELECTRICAL INSTRUMENT CO.,

Main Office and Works, Waverly Park, NEWARK, N. J.

**Illuminated Dial Station Instruments.**

These instruments are constructed upon the same general principle as our regular Standard Portable Direct Current Voltmeters and Ammeters, but are much tarier, and the working parts are inclosed in a neatly designed, dust-proof cast-iron case which effectively shields the instruments from disturbing influences of external magnetic fields.

BERLIN—European Weston Electrical Instrument Co., Ritterstrasse No. 88.

PARIS, FRANCE—E. H. Cadiot, 12 Rue St. Georges.

Weston Standard Illuminated Dial Potential Indicator, Style B.

**Weston Standard**

Portable Direct Reading Voltmeters and Millivoltmeters. Ammeters and Millammeters, Wattmeters and Voltmeters, for Alternating and Direct Current Circuits.

Our portable instruments are recognized as standards throughout the civilized world.

Our Semi-Portable Laboratory Standard Voltmeters and Ammeters are still better.

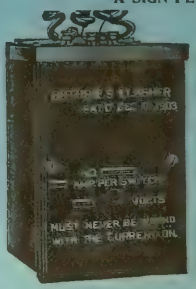
They are the most reliable, absolute standards for Laboratory use.

LONDON—Elliott Bros., Century Works, Lewisham.

New York Office—74 Cortlandt St.

**It Can't Be Beat—The Guthrie Flasher**

A SIGN FLASHER WITHOUT A MOTOR



Agents Wanted

A FEW ADVANTAGES OF THIS FLASHER OVER ALL OTHERS:

*First.*—The Price is lower.

*Second.*—It has fewer parts and is therefore the simplest flasher on the market.

*Third.*—It has no motor to cause trouble and consume current.

*Fourth.*—It costs nothing to operate this flasher.

*Fifth.*—It only occupies a space of 5x8 inches.

*Sixth.*—It can be regulated to flash any signs or show window lights in any manner desired.

Any combination of lights, without motor or cylinder.

Simplest and best on the market.

Works on any current.

The disadvantage of a flasher was the motor question.

We have overcome this and are putting out an article that meets a long felt want.

DOXSEE-BARRERE ELECTRIC CO. 1108-1110 Pine St., ST. LOUIS

**WESTERN ELECTRIC CO.**
CHICAGO OTHER LARGE CITIES NEW YORK

# "THE STANDARD" FANS

**A Confidential Talk About Prices.**

From the very beginning, "The Standard" Fans were designed for **quality,** and then the selling prices were based on the carefully studied costs.

This policy has resulted in reductions in price from time to time, as our increased output decreased the cost of production; but neither the price or the quality of "The Standard" Fans has ever been or ever will be **cut,** as we rely on our magnificent facilities rather than on enormous stocks for prompt delivery, and we never have to unload.

"The Standard" prices are always low and every purchaser of "The Standard" Fans gets a bargain.

We make ten models of fans, covering practically every requirement of the trade.

Ask for catalogues.

# GRAND PRIZE

**The Highest Possible Award**

**Has Been Given to**

ELECTRA

·TRADE MARK·

## HIGHEST GRADE NUERNBERG CARBONS

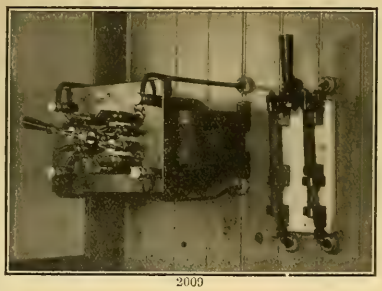
**By the International Jury of Awards, of the Louisiana Purchase Exposition, St. Louis, 1904.**

**HUGO REISINGER, Sole Importer, 11 BROADWAY, NEW YORK**

Variable Speed Single Phase Alternating Current

# VENTILATING FANS

WITH AUTO TRANSFORMER CONTROL Regulation from ⅛ to Full Speed



2009

The direct attachment of single phase motors to ventilating fans CAPABLE OF WIDE SPEED RANGE has been effected by us in the following sizes:

| 60 Cycle | Rev. per min. maximum speed | Cu. ft. Air per minute |
|---|---|---|
| ¼HP | 1165 | 1400 |
| ½HP | 1165 | 4800 |
| 1HP | 1165 | 10000 |
| 2HP | 1165 | 15000 |
| 3HP | 1750 | 20000 |

The use of our Auto-transformer for speed regulation thus eliminating the dead loss of the usual resistance controller is an excellent feature. The construction of this controller is illustrated herewith.

In small lighting plants where a storage battery for not to exceed 25-16 C. P. lamps for 8 hours is required. Also for telephone, fire alarm and police patrol work.

Prompt delivery made on rush orders.

**Northwestern Storage Battery Co.,**
**285 Madison St., - - - Chicago, Ill.**

## C H "Universal" Motor Speed Regulator

Both the Motor and Regulator are fully protected by the use of the Cutler-Hammer "Universal" speed regulator.

It also comprises every necessary device for the complete installation of a motor, being equipped with no voltage and overload release magnets, fuses and knife switch.

In case of cessation of current the operation of the no voltage magnet will allow the lever to return to "off" position. The overload magnet will act in the same manner for overloads up to 50 per cent increase of the normal current.

In case of heavier overloads, such as produced by short circuits, the fuses can be absolutely depended to blow without any arcing whatever.

Lever is held squarely over each segment. Automatic release from any segment.

Bulletin No. 42 gives prices and full description.

## The Accelerator is the Sole Exception

Every clutch ever made with the sole exception of the Accelerator depends entirely on friction for a starting torque.

The Accelerator gets most of its starting torque from induction—a magnetic drag that exerts its greatest strength at the start, thus using the least friction at the point where every other clutch experiences the most friction and consequently receives the most wear.

There is an elasticity to this drag. Just enough give to it to make a smooth, easy start.

The wearing surfaces of the Accelerator consist of a face of cast iron against a composite face of steel and babbitt. These faces are entirely immersed in oil which is not squeezed out until induction has fallen off. Wearing friction does not set in, until the two faces are revolving at almost the same speed.

These are the reasons why the Accelerator will last for years and years without any adjustment of faces.

Book One tells of the other qualities of the Accelerator which make it the ideal clutch. Why not send for it today?

## The Type "L-4" Enclosed Short Arc Lamp

is designed to operate in multiple on 100 to 125 volts direct-current circuits. Every portion of the lamp is carefully made and gives efficient service with a minimum of attention. The resistance is composed of small units, any of which may be removed should occasion require, without taking apart the frame or mechanism of the lamps. It has a length of 15 inches over all and is particularly adapted for low studded ceilings.

IF ELECTRICAL AND GOOD WE SELL IT
83-85-87 FIFTH AVE CHICAGO

We pat ourselves on the back and chuckle in a sort of self-satisfied way as we contemplate the recent rapid progress which we have made in electric lighting, electric transportation and the utilization of water power in the generating of electricity for commercial purposes—and we call this the age of electricity. We think we are pretty smart—and perhaps we are.

With a feeling of commiseration mixed with pity we consider our plodding forefathers, who were satisfied with the stage coach and the tallow dip.

Perhaps our forefathers entertained the same feeling when they looked back upon their forefathers.

When we are forefathers perhaps our descendants will smile as they consider our slow and old fogy ways.

Possibly they will with difficulty understand how we managed to get along with our present methods of transportation, lighting, etc.

The world is changing and progessing. The new supplants the old. The startling invention of today is superseded and made valueless by that of tomorrow.

But while you are here keep your mind awake, think hard, progress, and advertise your product in the Western Electrician.

**WANTED, FOR SALE** *and similar* **WANT COLUMN** *advertisements (50 words or less), $1.50 an insertion; additional words 3c each.* **POSITION WANTED** *advertisements (50 words or less), $1.00 an insertion; additional words 2c each.*

## WANTED

A good all-around man as engineer and electrician in a direct current plant in a good town of 1,200 people in Central Illinois. Must have enough technical education to be able to care for a storage battery in connection. Good hours, good wages, and a steady position to the right man. Address box 491, care of Western Electrician, 510 Marquette Building, Chicago, Ill.

## WANTED

In an Iowa electric light plant, competent engineer for station work. Must furnish references; state salary expected, experience, etc. Address BOX 487 care of Western Electrician 510 Marquette Bldg. Chicago, Ill.

## FOR SALE

An electric light plant in central New York. Street lighting contract and good business established. For particulars address M. C. E., No. 602 So. Warren St., Syracuse, N. Y.

## FOR SALE

Electric supply and contracting business; growing city of 25,000 people. Only a few thousand dollars required to purchase this excellent business. Address box 414. Greensboro, N. C.

## FOR SALE

Two hundred shares in a completely equipped electric light plant, heating and power plant, incorporated under the laws of Illinois and situated in a city of 2,500 inhabitants. The plant is thoroughly up to date, with complete duplicate equipment, is on a well-paying basis and is constantly increasing its list of customers. This stock is a controlling interest, being two-thirds of the entire stock issue of three hundred shares and the present owners of same wishing to retire from this line of business, will sell for $3,500 on easy terms as follows: $2,500 cash, and balance secured by the stock as collateral. The actual cost of the plant is $20,000 with a bonded indebtedness of $12,000 Inspection of plant invited at any time. Address STEWARD BROS. BANK, Plano, Ill.

As Sure As The Sun
Edison Primary Batteries
Formerly Edison-Lalande

One of their distinctive features is the sure and constant current delivery. They are so constructed that internal resistance grows less with use, polarization is completely obviated, and they work at full strength until all the energy of every element is exhausted. It will pay you to investigate their other points of superiority. Write for booklet No. 7.

Tenth Edition. Just Published.

## ELECTRICITY SIMPLIFIED

By PROF. T. O'CONOR SLOANE

158 Pages. Fully Illustrated. PRICE, $1.00

**Contents**

CHAPTER I. The Ether; Electricity; Force and Energy; Mass and Weight. CHAPTER II. The Electric Charge; Potential; The Dielectric; Positive and Negative Electricity; Contact Action; Electrostatic Lines of Force; The Leyden Jar.

CHAPTER III. The Electric Current and Circuit; Relations of Electromotive Force, Resistance and Current; Velocity of Electricity.

CHAPTER IV. Fundamental Units and the Relations Between Electrostatic and Electromagnetic Units; Fractical Units; the Volt, Ohm, Coulomb and Ampere; Electric Force, Work and Energy; Chemistry of the Current.

CHAPTER V. The Magnetic Circuit and Electromagnetic Lines of Force; Magnet and Ampere's Theory.

CHAPTER VI. Electromagnetic Induction and Action of Currents Upon Each Other; The Induction Coil and its Application.

CHAPTER VII. The Galvanic Battery; The Electrotype and the Locus of its Potential Difference; Polarization and Local Action; Different Examples of Batteries; The Arrangement and Action of Batteries; Storage Batteries.

CHAPTER VIII. Dynamos; Motors; Transmission of Power.

CHAPTER IX. The Telephone and Microphone; Electric Lighting; The Electric Telegraph; The Dangers of Electricity; Conditions for receiving a Fatal Shock.

Sixteenth Edition. Just Published.

## ARITHMETIC of ELECTRICITY

By PROF. T. O'CONOR SLOANE

165 Pages. Illustrated. PRICE, $1.00

**Contents**

CHAPTER I. Introductory. CHAPTER II. Ohm's Law CHAPTER III. Resistance and Conductance. CHAPTER IV. Potential Difference. CHAPTER V. Circular Mils. CHAPTER VI. Special Systems. CHAPTER VII. Work and Energy. CHAPTER VIII. Batteries. CHAPTER IX. Electro-Magnets. Dynamos and Motors. CHAPTER X. Demonstration of Rules. CHAPTER XI. Notation in Power of Ten. Tables.

## Standard Electrical Dictionary

By PROF. T. O'CONOR SLOANE

682 Pages. 393 Illustrations. PRICE, $3.00

**An Entirely New Edition, Brought Up To Date and Greatly Enlarged. Complete—Concise—Convenient.**

A practical handbook of reference, containing definitions of about 5,000 distinct words, terms and phrases.

The work is absolutely indispensable to all in anyway interested in electrical science, from the higher electrical expert to the everyday electrical workman. In fact it should be in the possession of all who desire to keep abreast with the progress of this branch of science.

Fifteenth Edition. Just Published.

## ELECTRIC TOY MAKING

KELLOGG PHILOSOPHY

# 4-11-44

## THE 4-PARTY HARMONIC SYSTEM OF THE KELLOGG SWITCHBOARD & SUPPLY CO. HAS 11 DISTINCT AND VALUABLE FEATURES AND THERE WILL BE AT LEAST 44 MORE EXCHANGES USING THE SYSTEM WHEN THEY FIND OUT ITS MANY POINTS OF SUPERIORITY.

FIRST:—
NO GROUND CONNECTIONS AT THE SUBSCRIBERS' STATIONS. GROUNDS ARE EXPENSIVE TO INSTALL AND MAINTAIN AND ARE APT TO INTRODUCE BAD INDUCTIVE DISTURBANCES.

SECOND:—
FREEDOM FROM INTERFERENCE. IN FOUR-PARTY SYSTEMS WHICH CONNECT BELLS TO THE EARTH, IF A SUBSCRIBER REMOVES HIS RECEIVER WHILE RINGING CURRENT IS ON THE LINE, THE PARTY OF LIKE POLARITY OR FREQUENCY ON THE OTHER SIDE OF THE LINE IS RUNG. NOTHING OF THIS SORT CAN HAPPEN WITH THE KELLOGG SYSTEM.

THIRD:—
THE RINGING IS NOT APPRECIABLY AFFECTED BY THE RESISTANCE OR CAPACITY OF THE LINE. THIS IS OF IMPORTANCE IN CITY EXCHANGES WHERE THE LINES ARE OFTEN LONG AND WHERE CABLE IS SO LARGELY USED.

FOURTH:—
THERE ARE NO ADJUSTABLE SPRINGS OR WEIGHTS.

FIFTH:—
THERE ARE NO RELAYS OR ADJUSTABLE RETARDATION COILS IN THE SUBSCRIBER'S STATION EQUIPMENT.

SIXTH:—
THE INSTRUMENTS FOR THE FOUR SUB-STATIONS MAY BE EASILY INTERCHANGED. ALL THAT IS NECESSARY TO CONVERT AN INSTRUMENT FOR USE AT ANY STATION IS TO CHANGE THE RINGER ARMATURE. THIS FEATURE MAKES IT UNNECESSARY TO CARRY A STOCK OF FOUR DIFFERENT KINDS OF INSTRUMENTS.

SEVENTH:—
WITH THE SAME EQUIPMENT TWO AND THREE PARTY SERVICE MAY BE GIVEN.

EIGHTH:—
THERE IS NO SMALL BUT CONSTANT BATTERY LOSS AS IN SOME FOUR-PARTY SYSTEMS. THE CONDENSER IN THE RINGER CIRCUIT STOPS THE BATTERY FLOW.

NINTH:—
A SPECIAL KEY FOR RINGING INDIVIDUAL LINE SUBSCRIBERS IS NOT REQUIRED, ONE OF THE FOUR-PARTY BUTTONS BEING USED FOR THIS PURPOSE.

TENTH:—
THIS SYSTEM CAN EASILY BE ADAPTED TO ANY TYPE OF SWITCHBOARD NOW ON THE MARKET.

ELEVENTH:—
THE HARMONIC RINGER IS SUBSTANTIAL IN CONSTRUCTION AND AS EASY TO MAINTAIN AND AS INEXPENSIVE AS THE ORDINARY POLARIZED RINGER.

SEND FOR BULLETIN NO. 10.

# IMPORTANT TELEPHONE BOOKS.

THE TELEPHONE HANDBOOK. By Herbert Laws Webb. 16mo, 150 pp. Price $1.00.
This handbook is a reliable treatise on telephony, and a practical book on telephone working and management, based entirely on standard American practice. It is extremely useful to telephone inspectors and operators.

AMERICAN TELEPHONE PRACTICE. By Kempster B. Miller, M. E. 510 pp. 380 illustrations. Price $3.00.
This is the first complete treatise on telephony in the English language. The text is profusely illustrated by cuts of commercial apparatus and carefully prepared diagrams of circuits. No diagram is given without a full explanation. The apparatus, circuits and methods of the American Bell Telephone Company and of the various independent companies are fully described. The apparatus and methods used in making all of the tests required in commercial telephone work are fully treated.

THE INSPECTOR AND TROUBLE MAN. By A. E. Dobbs. 106 pp. Price $1.00.
A practical book, written in plain language. Full of information and diagrams for the operator, exchange manager, inspector, trouble man and lineman. A complete description of telephones, how to find and remedy their troubles, together with working plans for exchange construction, complete with diagrams of all up-to-date telephones and switchboards.

A, B, C, OF THE TELEPHONE. By J. E. Homans, A. M. 352 pp. 269 illustrations. Price $1.00.
Owing to the demand for a comprehensive book giving a clear, terse idea of the principles governing the construction, installation, care and management of telephones and their appliances, this book has been compiled. It has been the aim of the author to make this the most complete elementary book on the subject for the practical electrician, wireman, lineman and engineer, and it is written in a clear and careful style.

THE PRACTICAL TELEPHONE HANDBOOK. By Joseph Poole, A. I. E. E. Second edition, revised and enlarged. 360 pp. 288 illustrations. Price $1.50.
In this work the writer has endeavored to produce a manual of moderate size and cost, but thoroughly practical, and detailing, as far as space will allow, the most recent methods of telephone working. While the requirements of telephone employes have been kept constantly in view it is fully intended also that the book shall be of service as a source of information on telephonic matters to users of the telephone and to the public generally.

PRACTICAL FEATURES OF TELEPHONE WORK. By A. E. Dobbs. 134 pp. Price 75 cents.
A simple, plain-speaking handbook for the practical telephone man.

TELEPHONE TROUBLES AND HOW TO FIND THEM. A complete handbook for telephone inspectors. By W. Hyde and J. H. McManman, edited by Prof. C. H. Haskins. Eighth edition. 16mo, 48 pp. Price 25 cents.
This little volume is an extremely practical work for telephone employes, written in a popular style and devoid of technicalities.

TELEPHONE LINES AND THEIR PROPERTIES. By Wm. J. Hopkins. Sixth edition. 272 pp. Illustrated. Price $1.50.

A MANUAL OF TELEPHONY. A new and large edition. By W. H. Preece, F. R. S., and A. J. Stubbs. 508 pp. 333 illustrations. Price $4.50.

TELEPHONES, THEIR CONSTRUCTION AND FITTING. A Practical Manual on the Fitting Up and Maintenance of Telephone and Auxiliary Apparatus. By F. C. Allsop. 191 pp. 168 illustrations. Price $1.25.

PATENTED TELEPHONY. A Review of the Patents Pertaining to Telephones and Telephonic Apparatus. Published by the American Electrical Engineering Association. Cloth bound; fully illustrated. Price, $1.50.

THE ELECTRIC TELEPHONE. By E. J. Houston, Ph. D., and A. E. Kennelly, Sc. D.; 12mo, cloth, 422 pp., 142 illustrations. Price $1.00.

HOW TO MAKE AND USE THE TELEPHONE. By Geo. H Cary. 136 pp.; illustrated. Price $1.00.

# THE AUTOMATIC

Is the telephone system that appeals to all.

**To the User,** because of its promptness, its accuracy, its secrecy;

**To the Operating Company,** because of its economy of operation and maintenance;

**To the Investor,** because it places the securities of a telephone company on a firm basis, and keeps them stable and profitable.

**Among the cities in which it has been adopted are:**

# THE TELEPHONE HAND-BOOK

**NEW AND REVISED EDITION, WITH A NEW CHAPTER ON "RECENT PROGRESS," BRINGING THE BOOK UP TO DATE.**

**BY HERBERT LAWS WEBB.**

*Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."*

**160 Pages, 133 Illustrations, Cloth, Hand-Book Size, Price $1.00.**

**Extract from Preface.**—"This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book on telephone working and management, and the TELEPHONE HAND-BOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice; and most of the material, apparatus and methods described are peculiar to or have originated in this country."

No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that anyone can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

CONTENTS.

CHAPTER 1. The Invention of the Telephone.
2. Sound Waves. Articulate Speech.
3. Electric Telephony. The Bell Telephone.
4. The Microphone.
5. Current Induction. Electromagnetic Induction.
6. The Induction Coil: Its Use in the Telephone Transmitter.
7. The Complete Telephone Circuit.
8. Magnet Telephones.
9. The Bell Telephone Receiver.
10. Other forms of Magnet Telephones.
11. The Gower, Ader and D'Arsonval Receivers, Mercadier's Bi-Telephone.
12. The Siemens, Kotyra, Neumayer and Böttcher Receivers.
13. Carbon Transmitters.
14. The Blake Transmitter.
15. The Long Distance Transmitter.
16. The Solid-back Transmitter.
17. The Berliner Transmitter.
18. The Cuttriss Transmitter.
19. Various European Transmitters.
20. The Efficiency of Carbon Transmitters.
21. Batteries for Telephone Work.
22. Open Circuit Batteries.
23. Closed Circuit Batteries.
24. The Practical Management of Batteries.
25. Magneto Bell.
26. Automatic Switches.
27. Telephone Line Construction.
28. Metallic Circuit.
29. Underground Wires
30. Lightning Arresters.
31. Inside Wiring.
32. Installation of Telephone Instruments.
33. Inspection and Maintenance.
34. The Condenser: Its Use in Telephony.
35. Electromagnetic Retardation.
36. Exchange Working.
37. Small Exchanges.
38. Party Lines: The Bridging Bell.
39. Long Distance Telephony.
40. Duplex Telephony.
41. Simultaneous Telegraphy and Telephony.
42. Recent Progress. Appendix.
